Sirs:

I'd just like to say thank you for holding the increase to Idaho Power down this time.

But now I hear they want to waste more money by putting in new meters. I suppose these digital things will be set at a higher measuring speed so they can appearing charge more well while ~~appearing~~ not too. I see nothing wrong with our old meters. Nor do I see that jobs of the readers need

Support Our Troops ~ Remember Our Veterans

V7716 cut out -

what I would like explained to me is the fabrication that it costs more to produce power at 4 PM than 8 AM or midnight???

The same dam & operators produce power the same way no matter the time of day. The same for coal or gas plants. Coal is used to heat water to make steam to turn the turbine. No change in how it does it at 8 AM or 4 PM or midnight.

So more is used from 5A-8A when people get up to go to work. That came about by using cities for population centers & increased populations. So we use some when we get home to cook our supper & do our chores that we can't do while at work. That is what was encouraged by the power industry & government & now they want to complain?!

So explain to me how it costs more depending on the hour of day when nothing changes?

Sincerely

Mrs. Sandra Schaler
