)
)

DIRECT TESTIMONY OF KEITH HESSING

IDAHO PUBLIC UTILITIES COMMISSION

FEBRUARY 20, 2004

1 Q. Please state your name and business address for
2 the record.

3 A. My name is Keith D. Hessing and my business
4 address is 472 West Washington Street, Boise, Idaho.

5 Q. By whom are you employed and in what capacity?

6 A. I am employed by the Idaho Public Utilities
7 Commission as a Public Utilities Engineer.

8 Q. What is your educational and experience
9 background?

10 A. I am a Registered Professional Engineer in the
11 State of Idaho. I received a Bachelor of Science Degree
12 in Civil Engineering from the University of Idaho in
13 1974. Since then, I have worked six years with the Idaho
14 Department of Water Resources, and two years with
15 Morrison-Knudsen. I have been continuously employed at
16 the Commission since August 1983.

17 As a member of the Commission Staff, my primary
18 areas of responsibility have been electric utility power
19 supply, revenue allocation and rate design.

20 Q. What is the purpose of your testimony in this
21 proceeding?

22 A. My testimony addresses Jurisdictional
23 Separations, Class Cost of Service, some Power Cost
24 Adjustment (PCA) components and cloud seeding.

25 Q. Please summarize your testimony.

1 A. I recommend that the Commission accept the 12
2 coincident peak (12CP) Jurisdictional Separation
3 Methodology proposed by the Company to allocate costs to
4 the Idaho jurisdiction. This method applied to Staff's
5 total Company Revenue Requirement results in an Idaho
6 Jurisdictional Revenue Requirement of \$498,758,249, which
7 requires an average 3.06 percent rate increase to recover
8 an additional \$14,796,880 revenue requirement.

9 Staff accepts the weighted 12 coincident peak
10 (W12CP) methodology proposed by the Company for the
11 purpose of allocating costs to the Company's Idaho
12 customer classes. Staff witness David Schunke proposes
13 some non-cost based modifications to these cost of
14 service results that become Staff's revenue allocation
15 proposal.

16 I review the Company's Power Cost Adjustment
17 (PCA) calculations that change as a result of a general
18 rate case. Staff recommends that the Commission accept
19 the Company's proposed changes except for the changes to
20 the Expense Adjustment Rate for Growth. The Company
21 proposes that the rate used to adjust actual power supply
22 costs to remove the costs of load growth be the embedded
23 cost of power supply which is 7.30 \$/MWh. I propose that
24 these changes from normal power supply costs occur at the
25 marginal cost of power supply and, therefore, the

1 marginal cost rate of 29.41 \$/MWh should be used in the
2 calculation.

3 Finally, my testimony discusses the Company's
4 cloud seeding program including its effects on the PCA.
5 I propose that there are questions regarding the program
6 that remain unanswered and that need to be answered
7 before the Commission can decide whether or not to accept
8 the costs include in this case. My testimony includes
9 some of those questions.

10 **JURISDICTIONAL SEPARATIONS**

11 Q. What are Jurisdictional Separations?

12 A. It is the process used to divide Idaho Power
13 Company's annual costs among the jurisdictions it serves.
14 In general the process identifies the Company's costs as
15 related to the supply of energy, peak demand, or the
16 number of customers. The costs are then divided to the
17 Idaho, Oregon or Federal Energy Regulatory Commission
18 (FERC) Jurisdictions based on each jurisdiction's
19 proportional amount of each of these items. The FERC
20 Jurisdiction consists of wholesale sales to other
21 utilities. The Jurisdictional Separation process results
22 in the Idaho Revenue Requirement, which is the amount of
23 the Company's total normal annual Revenue Requirement
24 that is caused by Idaho ratepayers and that must be
25 recovered from Idaho ratepayers.

1 Q. What has changed since the Company's last
2 general rate case that affects Jurisdictional
3 Separations?

4 A. Big changes have occurred in the allocation
5 factors. For example, the number of customers in Idaho
6 and on the total System grew substantially since the last
7 rate case, but the Idaho customer allocator only grew
8 about 1 percent. The story is very different for the
9 demand and energy allocators. Idaho's share of total
10 Company peak demand grew approximately 8 percent and
11 Idaho's share of total energy use grew approximately 9
12 percent. In all three cases Idaho's share of the total
13 has increased. Because these are the characteristics
14 used to divide or allocate costs among the jurisdictions,
15 the Idaho Jurisdiction has become a larger share of the
16 Company's total costs of providing service.

17 Q. Please explain in more detail the changes that
18 have occurred in these allocators since the Company's
19 last general rate case.

20 A. The addition of 100,000 new customers in Idaho
21 did not substantially change the Idaho customer allocator
22 because proportional growth occurred in the Company's
23 other jurisdictions. The growth in the relative
24 percentages of the energy and coincident peak demand
25 allocators requires more explanation. Total Company

1 energy consumption has declined and total Company peak
2 demand has not increased as fast as peak demand in Idaho.
3 There are a number of factors at play here. The large
4 increase in customers increased Idaho Peak demand and
5 energy requirements and Idaho Power lost its single
6 largest customer, FMC/Astaris. Since Idaho Power's last
7 general rate case, nearly all of its FERC Jurisdictional
8 contract sales expired as originally designed so that the
9 Company's resources could be fully utilized to supply its
10 load growth. These expired contracts practically
11 eliminated FERC Jurisdictional energy and peak demand.
12 When Idaho's share of peak demand is calculated, the
13 Idaho Jurisdiction becomes responsible for an additional
14 8 percent share of total Company demand-related costs.
15 When Idaho's share of total energy is calculated, Idaho
16 becomes responsible for an additional 9 percent of total
17 Company energy-related costs, not only because Idaho's
18 energy requirements increased but because total Company
19 energy requirements decreased.

20 Q. Have you prepared an exhibit that shows how
21 these allocation factors have changed since the Company's
22 last general rate case?

23 A. Yes. Staff Exhibit No. 118 shows these
24 changes. There are several different Energy, Demand and
25 Customer Allocators used in the Jurisdictional

1 Separations Study. The exhibit includes one of each for
2 illustrative purposes.

3 Q. Why has the Company not entered into firm
4 contracts to sell the unused energy made available by the
5 expiration of the FERC jurisdictional contracts?

6 A. Doing so would reduce Idaho's peak demand and
7 energy allocators. However, the Company has also changed
8 the load and water planning criteria in its Integrated
9 Resource Plan. In response to high costs experienced by
10 the Company and its customers in 2000 and 2001 when
11 streamflows were low and market prices were extremely
12 high, the Company now plans to meet its load during low
13 water conditions with reduced reliance on market
14 purchases. This change in planning criteria, coupled
15 with new customer load growth, has all but eliminated
16 excess energy available for new firm wholesale contracts.

17 Q. What happens to the uncommitted capacity that
18 is being held in reserve to meet above normal load and/or
19 below normal streamflow conditions?

20 A. In low water or high load conditions, the
21 reserve capacity is available to the Company and its
22 customers to meet load at a fixed price that will usually
23 be below the cost of purchasing market power. In normal
24 or above normal water conditions when the costs of
25 generating with these resources is below market price,

1 Idaho Power will sell the power and credit the revenues
2 against expenses, which reduces customer rates. In this
3 case, these benefits are captured in the power supply
4 modeling process that establishes normal power supply
5 costs included in base rates. On a year-by-year basis,
6 deviations from base power supply costs are captured in
7 the PCA.

8 Q. Does Staff agree with the Jurisdictional
9 Separations process used by Idaho Power Company?

10 A. Yes. The Company used the same 12CP
11 methodology that it has used for more than 20 years. It
12 is appropriate for changes in Company costs and changes
13 in jurisdictional use characteristics to change customer
14 rates. However, without compelling reason, it is not
15 appropriate to cause additional rate changes due simply
16 to change in allocation methodology. In its analysis,
17 Staff used the Company's methodology and jurisdictional
18 allocators with Staff's proposed accounting adjustments
19 to determine the Idaho Jurisdictional revenue
20 requirement.

21 Q. What are the results of Staff's Jurisdictional
22 Separations process?

23 A. Staff's cost of service results, revenue
24 allocation to classes and rate designs are based on a
25 total Idaho Jurisdiction revenue requirement initially

1 determined to be \$499,161,903 which is an increase of
2 \$15,200,534, and results in a 3.14 percent average
3 increase in rates. After that initial determination,
4 Staff auditors continued to examine specific items in the
5 Company's revenue requirement, which ultimately reduced
6 Staff's recommended Idaho Jurisdictional revenue
7 requirement to \$498,758,249, an increase of \$14,796,880,
8 or a 3.06 percent average rate increase. Because class
9 cost of service studies, revenue allocations and rate
10 designs involve complicated issues and analysis, it was
11 necessary for the Staff members working on those issues
12 to prepare their recommendations before the Staff
13 auditors had concluded their analysis. Accordingly,
14 Staff testimony on revenue allocation, cost of service
15 and rate design are based on the initial Staff
16 determination of the Company's Idaho Jurisdictional
17 Revenue Requirement. Staff Exhibit No. 119 summarizes
18 the results of Staff's jurisdictional separations study.
19 Staff witness Schunke's testimony provides revenue
20 allocation and rate design guidelines for the
21 Commission's consideration that accommodate the reduced
22 Staff revenue requirement proposal.

23 **COST OF SERVICE**

24 Q. What is a cost of service study?

25 A. A cost of service study divides the Idaho

1 Jurisdictional Revenue Requirement among the Company's
2 various customer classes based on the cost-causing
3 characteristics of the classes. The process is similar
4 to the Jurisdictional Separations process. Allocators
5 are developed for each customer class as percentages of
6 the Idaho total for energy use, contributions to monthly
7 coincident peak demand and numbers of customers. These
8 allocators are then used to distribute the total Idaho
9 Revenue Requirement to the various customer classes.

10 Q. What class cost of service methodology did the
11 Company use?

12 A. The Company used substantially the same
13 methodology that it has used in its last two general rate
14 cases. The method is called the weighted 12 coincident
15 peak (W12CP) method. For the allocation of production
16 related costs, this method weights monthly coincident
17 peak demands by the marginal cost of providing for those
18 demands and averages the results with unweighted 12CP
19 results. In months when the Company is not expecting a
20 peak demand deficit, a zero weighting is applied. When
21 seven of the months are weighted at zero, the allocators
22 become the average of, what amounts to, a weighted 5CP
23 methodology (the remaining five months of coincident peak
24 demands) and an unweighted 12CP methodology.

25 The same method is used for the allocation of

1 transmission related costs except on the transmission
2 system there are nine months when the Company does not
3 expect peak demand deficits. Therefore, only three
4 weighted months are averaged with the 12CP numbers to
5 obtain the proposed allocation factors. The major energy
6 allocator is calculated based on monthly energy use
7 weighted by the monthly marginal cost of energy. It is
8 not averaged with other unweighted allocators.

9 Steam and Hydro production investment are
10 classified as related to demand or related to energy
11 based on an Idaho Jurisdictional Load Factor (the ratio
12 of average use to peak use) of 55.26 percent. This means
13 that 55.26 percent of these investments are allocated to
14 customer classes based on energy use and the remaining
15 amount is allocated based on peak demand.

16 Q. What has changed since the Company's last
17 general rate case ten years ago that affects cost of
18 service?

19 A. There have been many changes. A few of the
20 changes are: the addition of 100,000 new customers, the
21 loss of the FMC/Astaris load, the change in the Company's
22 load and water planning criteria to a more conservative
23 position, the deregulation of the wholesale electric
24 market, and the change in the Company's load/resource
25 characteristics from being energy constrained to capacity

1 constrained.

2 Q. How might these changes affect cost of service
3 results?

4 A. These changes affect the Company's underlying
5 costs, the energy and capacity allocators applied to each
6 customer class, and the marginal costs used to weight the
7 allocators. Virtually everything that affects cost of
8 service, except the basic methodology, has changed.

9 Q. Please describe the cost of service analysis
10 performed by Staff.

11 A. Staff used the Company's W12CP methodology that
12 has been accepted by the Commission in past proceedings.
13 Staff also used the weighting factors and associated
14 methodology proposed by the Company in recognition that
15 capacity and energy are more costly to obtain in some
16 months of the year. Staff recognizes that weighted
17 months, some of which were weighted at zero, averaged
18 with unweighted months, creates demand allocators that
19 are more complex than those used in the past. Staff can
20 accept the use of some zero weighted months because they
21 are averaged with unweighted months and because they
22 coincide with the months where no capacity constraint is
23 expected. Staff Exhibit No. 120 shows the results of
24 Staff's Cost of Service Study. In his testimony, Staff
25 witness Schunke proposes a modified allocation of revenue

1 requirement to customer classes that is not entirely
2 based on cost of service results.

3 Q. Are unweighted and zero weighted months the
4 same thing?

5 A. No. If the peak demand for a month is zero
6 weighted, it is multiplied by zero and no value is
7 included in the calculation of the weighted allocator for
8 that month. If the peak demand for a month is
9 unweighted, the actual coincident peak demand is used in
10 the calculation of the allocator.

11 Q. How many cost of service studies did Staff
12 perform?

13 A. Staff performed three cost of service studies.
14 I have already described the first one which is the study
15 recommended by Staff.

16 Q. What was the second study performed by Staff?

17 A. The second study is a weighted 12CP study with
18 the weighted portion of the June allocator weighted at
19 zero. The resulting ratio was averaged with the
20 unweighted ratio to obtain the final allocators. The
21 results of this study are shown on Staff Exhibit No. 121.
22 The results of this study showed a decrease in the
23 required increase for the irrigation class. The increase
24 dropped from 47.2 percent to 44.5 percent.

25 Q. Please discuss Staff's third cost of service

1 study.

2 A. The third study is a traditional unweighted
3 12CP study. The analysis removed all marginal cost
4 demand and energy weightings used to calculate
5 allocators. Weightings were removed in the calculation
6 of production and transmission demand allocators and for
7 the calculation of the energy allocator. Staff Exhibit
8 No. 122 shows the results of the study. When all
9 weightings were removed, which is the same as setting
10 them at 1, the required increase in irrigation rates
11 dropped again, this time to a 29.1 percent increase. Of
12 course, any time the allocation drops for one class the
13 other customer classes pick up the difference to produce
14 the revenue required to cover the Idaho jurisdictional
15 revenue requirement.

16 Q. Why did Staff perform the second and third
17 studies?

18 A. The results of the Company's W12CP methodology
19 require a substantial increase to bring the irrigation
20 class to full cost of service, as might be expected with
21 capacity and energy allocators more heavily weighted in
22 summer months. Staff wanted to know how sensitive class
23 allocations, especially irrigation class allocations, are
24 to allocation factor changes. All three studies show the
25 irrigation class requiring an increase far above any

1 other class. Using the Company's methodology, as Staff
2 did in its first study, the irrigation class would
3 require an increase five times the next highest class
4 increase.

5 Q. Please compare the effects of the unweighted
6 12CP methodology and the Company's W12CP methodology on
7 the Residential customer class.

8 A. The results of the weighted 12CP study showed a
9 1.08 percent decrease for residential customers.
10 Unweighted study results showed residential rates
11 requiring a 1.71 percent increase. Given the residential
12 customer's summer air conditioning load these results may
13 seem inconsistent. However, a more detailed review of
14 residential load data provides an explanation. The
15 winter heating load is greater than the summer air
16 conditioning load and January and February are zero
17 weighted in the weighted 12CP production allocator.
18 Also, all winter months are zero weighted in the weighted
19 12CP transmission allocator. The result is a relatively
20 small effect on residential cost of service regardless of
21 the allocator weightings used in the cost of service
22 study.

23 Q. Why did Staff choose the Company's proposed
24 cost of service methodology including its allocator
25 weightings?

1 A. Staff believes that demand-related plant
2 investments are driven by low hydro conditions and high
3 loads in the critical peak months. It is the demand in
4 these critical months when the system is capacity
5 constrained that is most relevant in this analysis.
6 Therefore, any analysis that does not weight the critical
7 months more heavily than shoulder months does not
8 correctly reflect forward-looking demand related costs.
9 The Company's study gives heavier weighting to the five
10 critical months of June, July, August, November and
11 December. Therefore, Staff believes that the monthly
12 weightings are justified and that the Company's cost of
13 service methodology is reasonable.

14 **THE POWER COST ADJUSTMENT (PCA) MECHANISM**

15 Q. What is the PCA?

16 A. In general, the PCA is a rate adjustment
17 mechanism that annually adjusts customer rates to recover
18 or refund 90 percent of above or below normal load
19 adjusted power supply costs. Each year the PCA is
20 composed of a forecast or predicted component and a true
21 up component.

22 Q. What PCA items does your testimony discuss?

23 A. Base power supply costs are established in a
24 general rate case and those are discussed in Staff
25 witness Rick Sterling's testimony. From the process that

1 establishes base power supply costs comes the PCA
2 forecast, which I will discuss. I will also discuss the
3 load adjustment and some other components of the PCA
4 calculation.

5 Q. How will the results of this rate case change
6 the PCA?

7 A. The normalized power supply costs established
8 in this proceeding will be included in the base rates of
9 each customer class. The annual projection or forecast
10 of power supply costs based on water conditions will also
11 change. A change in base power supply costs will cause a
12 recalculation of the predictive formula that relates
13 April through July Brownlee inflow to Net Power Supply
14 Costs. Each April this formula along with the National
15 Weather Service runoff forecast is used to project net
16 power supply costs for the coming year. Company witness
17 Greg Said discusses this calculation in his direct
18 testimony beginning at page 16. Page 19 of his testimony
19 shows the Company-proposed forecast formula. Company
20 Exhibit No. 35 shows the input data and regression
21 results.

22 Q. Does Staff agree with the Company's calculation
23 of the forecast formula?

24 A. Yes. Staff has not adjusted the Company's
25 power supply model results in this case and proposes no

1 changes in the forecast methodology other than exclusion
2 of the FMC/Astaris adjustment proposed by Company witness
3 Said (Direct Testimony, page 19, lines 17-24).
4 Therefore, Staff calculates the same forecast formula as
5 the Company.

6 Q. Does the Company propose to update other PCA
7 computations?

8 A. Yes. Company Exhibit No. 36 shows four PCA
9 computations that Company witness Said proposes to
10 update. He updates "Normalized PCA Expenses" which is
11 normalized power supply expense from the Aurora model
12 plus normalized CSPP costs. The new number is
13 \$94,101,100 per year.

14 The Company updates the "Normalized Base PCA
15 Rate" which is normalized PCA expenses divided by
16 normalized system firm sales. The new rate is .7315
17 ¢/kWh.

18 Idaho Power also updates the "Idaho
19 Jurisdictional Percentage" which is used to allocate
20 abnormal power supply costs to Idaho. It is calculated
21 by dividing normalized system firm load by Idaho
22 jurisdictional firm load. The number is 94.1 percent.

23 Finally, the Company updates the "Expense
24 Adjustment Rate for Growth" which is used to remove power
25 supply cost increases associated with growth. Mr. Said

1 calculates 13.98 \$/MWh in the exhibit but uses a
2 different rational to propose 7.30 \$/MWh in his
3 testimony.

4 Q. Is it appropriate to update these calculations
5 in this general rate case?

6 A. Yes. These calculations are intended to be
7 updated in a general rate case.

8 Q. Does Staff accept the results of the updated
9 calculations for use in the PCA?

10 A. Staff accepts the Company's updated
11 calculations as shown on Company Exhibit No. 36, except
12 for the calculation of the Expense Adjustment Rate for
13 Growth. Staff disagrees with the Company's rational for
14 and calculation of this adjustment.

15 Q. Please discuss the Expense Adjustment Rate for
16 Growth.

17 A. Such a discussion requires some basic PCA
18 background. The PCA captures actual booked monthly power
19 supply costs that are above or below the normal values
20 established by the Commission and included in base rates.
21 These differences from normal power supply costs result
22 from abnormal streamflows, abnormal market prices,
23 abnormal fuel prices, abnormal loads that may be caused
24 by weather, buy-back programs, conservation, or load
25 growth or loss. The Expense Adjustment Rate for Growth

1 (EARG) is aimed very specifically at the variable cost of
2 power supply caused by changes in load. When load grows,
3 the EARG is part of the mechanism that removes the above
4 normal costs of power supply captured in PCA accounts
5 that are associated with load growth. In essence this
6 adjustment removes the power supply effects of load
7 growth and leaves the effects of abnormal water
8 conditions and market prices, which the PCA is designed
9 to capture.

10 When loads are below normal, the EARG
11 multiplier is part of the mechanism that prevents the
12 Company from losing both the retail revenue and power
13 supply cost savings that are credited back to customers
14 through the PCA. Again, this adjustment removes from the
15 PCA the power cost effects of the loss in load and leaves
16 the effects of abnormal water and market prices in the
17 PCA. When these adjustments are appropriately made using
18 the correct multiplier, the Company neither over-collects
19 nor under-collects power supply costs through the PCA
20 when consumption is higher or lower than normal. The
21 difference between power supply costs incurred to serve
22 new customers and embedded power supply costs collected
23 in rates must still be recovered in a general rate case
24 just as it has been in the past. The PCA is left to
25 capture predominantly power supply cost changes that

1 result from abnormal water and market price conditions
2 that would not be captured under the normal conditions
3 assumed in a general rate case.

4 Q. You mentioned that the load adjustment
5 mechanism works if the correct value is used as the
6 Expense Adjustment Rate for Growth. What is the correct
7 EARG value?

8 A. Power supply costs associated with load changes
9 are captured in the PCA at the marginal cost level.
10 Therefore, they must be removed at the marginal cost
11 level. In Response No. 30 to the Second Production
12 Request of the Idaho Irrigation Pumpers Association,
13 Idaho Power identified the average annual marginal cost
14 of energy as 27.01 \$/MWh. This is Staff Exhibit No. 123.
15 At the customer level, which includes 8.9% transmission
16 and distribution losses, this becomes 29.41 \$/MWh. I
17 propose this as the appropriate EARG.

18 Q. What is the current EARG and where did it come
19 from?

20 A. The current EARG is 16.84 \$/MWh and it was
21 established in Case No. IPC-E-92-25, the case that first
22 established Idaho Power's PCA mechanism. Staff proposed
23 16.84 \$/MWh in that case as a surrogate for the average
24 marginal cost of power supply. It was calculated as the
25 average of Boardman and Valmy fuel costs which at that

1 time spanned the range of normal market prices. A
2 surrogate for Idaho Power's marginal cost of power supply
3 was proposed in that case because Staff did not have an
4 operating power supply model that would allow it to
5 incrementally adjust the load and calculate the marginal
6 cost. In the Company's last general rate case, Case No.
7 IPC-E-94-5, 16.22 \$/MWh was calculated from an
8 incremental power supply model run. No recommendation
9 was made to change the 16.84 \$/MWh EARG because the
10 difference was small.

11 Q. What would be the result if the Commission
12 adopted the Company's proposal to use the average power
13 supply cost of 7.30 \$/MWh for the Expense Adjustment Rate
14 for Growth?

15 A. The difference between the actual marginal
16 power supply costs of 29.41 \$/MWh incurred to serve new
17 customers and the 7.30 \$/MWh embedded cost proposed by
18 the Company would be collected from customers through the
19 PCA and flowed through to Idaho Power Company
20 shareholders. In other words the Company would collect
21 power supply costs from new customers through base rates
22 and collect 22.11 \$/MWh (29.41 - 7.30) for new growth
23 through a PCA surcharge. While the Company has argued
24 that the revenue it receives from new customers does not
25 cover all the incremental costs of adding them, the EARG

1 proposed by the Company amounts to a windfall that more
2 than recovers power supply costs. As I have previously
3 stated, a general rate case, rather than the PCA, is the
4 appropriate place to recover load growth related power
5 supply costs. Therefore, Staff recommends that the
6 Commission adopt its Expense Adjustment Rate for Growth
7 of 29.41 \$/MWh to eliminate the shareholder windfall and
8 maintain the integrity of the PCA.

9 **CLOUD SEEDING**

10 Q. What is your understanding of the Company's
11 cloud seeding program?

12 A. Several years ago, members of the Commission
13 Staff, including myself, met with Idaho Power Company to
14 discuss cloud seeding. At that time the Company was
15 considering a pilot program to seed clouds in the upper
16 Payette River drainage. The Company's goal was to
17 provide more precipitation in that area in the form of
18 snow that would melt during the summer and provide
19 additional water to the Company's hydro facilities,
20 allowing it to generate more electricity.

21 Part of the reason for the meeting had to do
22 with the effects on the PCA of such a proposal. To the
23 extent more water could be provided to generate more
24 electricity, the value of that electricity would be
25 captured by the PCA and substantially (90%) passed back

1 to ratepayers. This would leave customers with the
2 benefits and the Company's shareholders with the costs.
3 The Company did not believe this distribution of costs
4 and benefits to be fair. One alternative discussed was
5 to allow the Company to include the costs of cloud
6 seeding in the PCA so that customers would pay the costs
7 and receive the benefits. Of course, if the benefits did
8 not exceed the costs, the loss would be passed to
9 customers through PCA rates.

10 Another alternative for cost recovery discussed
11 at the meeting was that the Company simply begin the
12 program and incur and book the costs. The next general
13 rate case would then pick up a test year that included
14 the costs, at which time they could be discussed and the
15 Commission could choose to accept or reject them.

16 Rather than seeking recovery through the PCA,
17 the Company has included cloud seeding costs for the 2003
18 test year in this case. Those costs include \$897,448 in
19 operation and maintenance expense (Account 536) and
20 \$214,600 in capital costs (Account 101).

21 Q. Does Staff have a position regarding the
22 recovery of these costs in the current case?

23 A. The Company did not provide enough information
24 in its filing for Staff to make a recommendation on the
25 merits of cloud seeding. For example, the Company did

1 not state whether the program has created measurable
2 precipitation and, if so, how much. Without more
3 information it is not possible to evaluate whether the
4 cloud seeding costs were prudently incurred. If the
5 Company does not provide additional information in this
6 case, Staff recommends that all cloud seeding costs be
7 removed.

8 Q. What information does Staff believe should be
9 provided by the Company to allow an adequate opportunity
10 to evaluate the requested cost recovery?

11 A. Given the experimental and somewhat
12 controversial nature of cloud seeding programs and the
13 sizable amount of money requested to be included in rates
14 on an annual basis, Staff believes the Company should
15 address the following issues:

16 1) What activities constituted the cloud
17 seeding program in past years, including the test year,
18 and what are the Company's cloud seeding plans for
19 upcoming years?

20 2) What criteria will the Company use to
21 determine the level of cloud seeding activity and
22 expenditures necessary in any given year?

23 3) How does the Company evaluate whether cloud
24 seeding works and that the benefits exceed the costs?

25 4) What would be the effect on the Company's

1 cloud seeding program if the Commission denied recovery
2 of the costs requested in this case?

3 Q. Does this conclude your direct testimony in
4 this proceeding?

5 A. Yes, it does.
