# **Idaho Economic Forecast**

## **Introduction & Overview**

## **INTRODUCTION**

The 2003 Economic Forecast for the State of Idaho provides projections of population, households, personal income, and employment by major industry in the state for the years 2002-2030. In addition, this volume also contains the 2003 Idaho County Economic Forecast. The 2003 Idaho County Economic Forecast presents annual projections of population, households, personal income, and employment by major industry categories for each county in Idaho for the years 2002 to 2030

Because of the national recession and an economic slowdown in Idaho this economic outlook presents lower levels of future economic expectations for the state when compared to the 2001 and 2002 Idaho Economic Forecasts.

### **The National Economy:**

Economic activity in the nation had been moderating since mid-year 2000. However, high levels consumer spending provided the necessary buoyancy to keep the US economy out of a recession. Many observers of the national economy held out the hope that the FED's aggressive interest rate cuts and the federal government tax rebates in 2001 would prevent a full-blown recession.

These expectations were based upon the view that the Federal tax rebates in conjunction with a stimulated housing market – due to FED monetary policy actions – would keep consumer spending going until business investment spending gained some traction in response to the FED interest rate cuts. The hope was that the economy would be able to negotiate a “soft-landing” – a leveling out of economic activity, without a recession, before again resuming a path of economic growth.

Nevertheless, the US economy officially slipped into a recession in the second quarter of 2001. And, the events of September 11, 2001 dashed any hopes for a quick economic recovery. Consumer confidence fell, business spending and profits dived, and the number of unemployed in the US rose dramatically. Offsetting these contractionary economic events were dramatic increases in federal government spending for reconstruction and enhanced defense measures.

One year ago the conventional wisdom was that an economic recovery would be forthcoming by in the second quarter of 2002, nearly one year after the official start of the recession.

A stunning 5.6% increase in real GDP in the first quarter of 2002 seemed to be the harbinger that the recession was over and that recovery was just around the corner. However, analysis of the underlying causes of that surge in economic growth seems to indicate that it was an abnormality that may not be repeated soon.

Final demand for goods and services, which ultimately drives economic production, grew at a weak 2.0% in the first quarter of 2002. The remainder of the first quarter GDP surge was made of a increase in business restocking activity. While this kind of activity can and did provide a boost to economic activity it is not sustainable unless final demand for goods and services increases at a rate that is closer to the true growth potential of the economy. That is currently estimated to be about 3.2% per year. Therefore restocking activity will only propel GDP growth for a few quarters. After that, if demand does not catch up, economic activity will slip again.

The estimates of US real GDP growth in the second quarter of 2002 (1.2%) seem to confirm this hypothesis. While the majority of economists assure that the US economy will get back to rates of growth that match its potential, they are less sure of the timing.

The current indications are that the official fourth quarter 2002 GDP growth figures will also be weak. At the end of 2002 the outlook for the US economy was for further weakness in the near-term before any overall economic gains would be realized. Today the hope is that US economic activity will regain momentum after mid-year 2003.

The one-time boosts of consumer spending due to tax refunds propped up economic activity in the first quarter of 2002. In addition, a rush of home mortgage refinancing activity during the year increased the free cash flow of US households. However, refinancing activity has slowed recently. Employment growth in the nation is lagging, pay gains have moderated, and energy prices have risen significantly. Add to that the fact that businesses are not yet ready to resume investing, state and municipal governments facing budget shortfalls will, in all likelihood, be cutting expenditures in the next year,

and federal government expenditures can not maintain their current rate of growth.

The stock market and currently weak stock prices make it more difficult for companies to raise funds through new equity issues, which means less new investment and job creation. But this is not all bad; the scarcity of funds means that only the more promising ventures will be funded.

In addition investor disillusion with the stock market also means that interest rates are lower than they would be otherwise. This is because as investors attempt to shift from stocks to bonds (attempt, because someone has to hold the stock), stock prices fall and bond prices rise, lowering yields and thus the interest rate that must be paid on net borrowing.

The stock market will recover when profits recover, although the stock market's recovery may lag the national economic recovery because of the rich valuations that still exist in the equity markets today. Profits will pick up along with demand. Companies have spent much of the last year reducing costs. However, to date most companies that are reporting higher profits have done so not by increased sales but by lowering expenses. Ongoing profit growth, however, requires growth in the top line – revenues. That will come slowly, since the consensus seems to be that there is little pent-up demand for houses, cars, investment goods, or much of anything else.

In general, the recovery from this recession could be slower and longer than had initially been expected. Real GDP in the nation increased by 4.1% in 2000 before falling into recession during 2001 with a more modest 1.2% increase in real GDP for the year. When the final 2002 numbers are in real GDP growth in the nation is predicted to increase by nearly 2.2%, a modest improvement from the lackluster 2001 pace.

At this point in an economic recovery one expects that economic activity will gain momentum as the economy further strengthens. However, 2003 is not truly expected to be the year that puts the nation on the fast track to economic recovery. DRI-WEFA predicts that real GDP will only increase by 3.4% in 2003. Thereafter they expect US real GDP to increase by 3.8%, 3.1% and 2.7% in the years 2004, 2005, and 2006, respectively.

It is predicted that nominal personal income growth in the nation will average 3.3% in 2002 – a significant decrease from the 7.0% pace of 2000 and the 4.9% rate in 2001. For the years 2003 through 2008, DRI-WEFA predicts that nominal personal income gains in the US will average 5.5% per year. During the same time consumer price inflation, as measured by the Consumer Price Index (CPI-U), is expected to increase from the 1.8% rate experienced in 2002 to a annual average pace of 2.8% per year for the 2003 to 2008 period.

### The Idaho Economy:

The Idaho economy slid into a period of slower growth in 2001. In the prior two years, 1999 and 2000, nonagricultural employment in Idaho increased by 3.3% and 3.8%, respectively. Nevertheless, in this national economic slowdown Idaho followed the nation into the economic doldrums. From the onset of 2001, and with each successive calendar quarter, non-ag employment in the state slowed – from a 3.1% rate of growth in the first quarter of 2001, to a 1.9% gain in the second quarter, to 1.2% in the third quarter, and to finally a 0.9% addition in the fourth quarter. For the year 2001 as a whole non-ag employment growth in Idaho posted an annual average increase of 1.8% over 2000 levels. But, the slowdown continued in 2002. By the first quarter of 2002 Idaho could only produce a 0.4% increase in nonagricultural employment. And, the situation did not improve. Nonagricultural employment statewide decreased in the second, third, and fourth quarters of 2002 by 0.4%, 1.3%, and 1.3%, respectively, from prior year levels. By the fourth quarter of the year non-ag employment in the state was off nearly 6,400 jobs from fourth quarter 2001 levels.

Nonagricultural employment in the Boise MSA (Ada and Canyon counties) which had been at the forefront of the state's employment gains did not fare better than the state as a whole during this economic slowdown. In the years 1999 and 2000 non-ag employment in the Boise MSA increased by 4.2% and a robust rate of 7.0% in the year 2000. Nevertheless, the MSA and the state experienced the same quarter-by-quarter slowdown in employment gains in 2001. In the first quarter of 2001 non-ag employment in the Boise MSA posted a strong 6.0% gain over first quarter 2001 levels of employment. But, the employment gains in the Boise MSA mirrored the state with increases of 2.5%, 0.3%, and 0.1% in the remaining three calendar quarters of 2001. And, in 2002 nonagricultural employment in the Boise MSA

remained even with the levels of the prior year in the first quarter of 2002. Thereafter, a 0.2% increase in the second quarter of 2002 marked the high point for the year to be followed by decreases in non-ag employment of 0.5% and 1.5% in the third and fourth quarters. In terms of economic growth, the slowdown experienced in the Boise MSA during 2001 and 2002 was like an emergency stop.

### **The Economic Gains of the 1990's:**

Idaho experienced strong economic growth in the 1990's. Overall gains in nonagricultural employment in the state averaged nearly 3.8% per year, growing from a 1990 average of 384,900 to an annual average level of nearly 559,600 in 2000. In comparison, nonagricultural employment in the nation increased at an annual average rate of 1.9% per year during the 1990s.

Idaho's manufacturing and service industries posted particularly strong gains in the 1990s. Over the decade Idaho gained 13,500 new manufacturing jobs -- an annual average increase 1.9% per year over the ten-year period. And while the gains in manufacturing employment statewide were not particularly strong in comparison to Idaho's overall rate of job creation, it was a sharp contrast to the 0.03% per year annual average decrease in manufacturing employment nationwide during the decade.

Furthermore, the changing mix of Idaho's manufacturing industries over the past twenty years has been notable. Today, Idaho's traditional natural resource based manufacturing industries - Food Processing, Lumber and Wood Products, and Primary Metals - no longer have the same degree of dominance of the manufacturing sector that they once held. In 1970, the state's manufacturing industries of Food Processing, Lumber, and Primary Metals accounted for close to 73% of Idaho's total manufacturing employment. But, these industries had fallen to account for 64% and 51% of Idaho's total manufacturing employment in the years 1980 and 1990, respectively. And, the downward trend did not stop there. At the end of 2000, Food Processing, Lumber and Wood Products, and the Primary Metals industries could only account for 39% of Idaho's total manufacturing employment. In absolute terms, these three "traditional" manufacturing industries in Idaho lost nearly 2,300 jobs in the decade of the 1990s.

Nevertheless, this drop in employment over the last decade was not enough to account for their precipitous decline as a share of total manufacturing employment in Idaho. Many other sub-categories of the state's manufacturing sector posted significant additions in employment during the previous two decades.

In particular, the Non-electrical Machinery and Electrical and Electronic Equipment manufacturing industries experienced strong growth. In just the past decade these two manufacturing industries, in total, increased their manufacturing employment from 12,600 in 1990 to nearly 24,200 in 2000. The employment gains in the Non-electrical Machinery and Electrical and Electronic Equipment manufacturing industries accounted for nearly 86% of the state's overall manufacturing job growth in the 1990s. Furthermore, the majority of these new "high-tech" jobs were created in only three of Idaho's forty-four counties; Ada, Canyon, and Bannock. More specifically, the 8,600 Non-electrical Machinery and Electrical and Electronic Equipment manufacturing jobs gained in the Boise MSA (Ada and Canyon counties) in the 1990s accounted for 74% of the state's overall "high-tech" employment gains of 11,600 jobs during the decade of the 1990s.

However, because of this changed mix of manufacturing employment the economic forces that the state faces today are much different from those of the past. In turn, these forces will influence the future of the state's economy.

Many have argued that a more diverse manufacturing product mix should be good for Idaho's economy because it is more diverse and therefore less vulnerable to the cyclical swings of the past. Prior to the rise of Idaho's "high-tech" manufacturing industries the state seemed to be perpetually caught in the midst of the natural resource industry cycles of boom and bust. To an extent, those cycles remain today.

The decline in the relative importance of the natural resource based manufacturing industries in the state during the last three decades was caused by many national, international, and local factors. Obviously, the "big picture" market influences -- interest rates, inflation, our nation's trade policies with other nations, and then subsequently, the demand for housing -- have severely affected Idaho's natural resource manufacturing industries. These influences only affect small portions of overall national and international

economies. Nevertheless, they have in the past, and will in the future, continue to cause major economic dislocations in local areas of Idaho. Over the past three decades these dislocations put heaviest burden upon those Idaho communities that were highly dependent upon the extraction or processing of natural resources. However, many of those forces and burdens have not eased and many communities that are still heavily dependent upon jobs in agriculture, food processing, lumber, or mining remain severely depressed today.

Ironically, Idaho's "high-tech" manufacturing employment gains of the past two decades are now subjected to similar "big picture" economic influences and strong economic cycles. These economic cycles have been at the root of Idaho's current economic slowdown.

#### Idaho's Manufacturing Outlook:

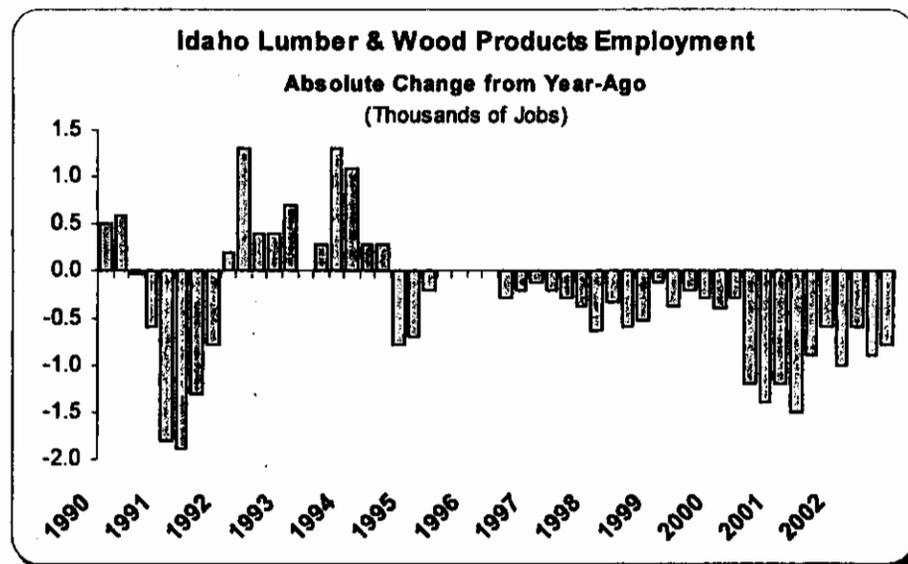

The economic prospects for the lumber industry in Idaho has not improved since last year's forecast. In recent years lumber mills have closed in Cascade, Council, Horseshoe Bend, Grangeville, Post Falls, and Salmon Idaho and in the eastern Oregon towns of Burns and Joseph. The lack of timber supply, high stumpage prices, and low market prices for finished wood products are all cited as causes of the current contraction in Idaho's lumber industry. Furthermore, this ongoing contraction has taken place in the midst of a strong US housing market. Traditionally this would be a situation leading to strong demand and, at the least, stability in the lumber industry.

Therefore, the economic outlook for Idaho's Lumber and Wood Products industry is not one of improvement.

In the 1990s lumber industry employment in Idaho fell from a "high" of 15,460 in 1994, to 12,600 in 2000. In 2001 and 2002 Lumber and Wood Products employment in Idaho fell by 8.7% and 7.0% respectively. At year-end 2002 there were only 10,400 people employed in the state's Lumber and Wood Products industry.

In this economic outlook, Lumber and Wood Products employment in Idaho is not expected to exceed current levels of employment and will post employment losses at an annual average rate of nearly 0.8% per year over the period 2000 to 2025. Furthermore, current trends make it likely that only

those Wood Products firms involved in the production of specialty wood products – wood moldings, wood trim, doors, windows, and specialty wood products – will become the sole source of future employment gains in Idaho's lumber industry.

In 1990s Idaho's Food Processing industry continued to expand into products that were, for Idaho, nontraditional. In particular, the growth of the state's dairy industry and the subsequent employment gains in the processing of milk products was the industry's stellar performer during the past decade.

In 2001, Idaho was ranked as the sixth largest state in the nation in terms of annual milk production – at 7,757 million pounds. Milk production in Idaho increased 163% since 1990 – representing an annual average increase of 9.2% per year. Most of the state's milk is processed into cheese. In 2001 the US Department of Agriculture estimates that Idaho food processors produced nearly 569 million pounds of cheese. That is a 219% increase in the state's annual cheese production since 1990. Today, nearly 1,600 people are employed in Idaho's Food Processing industry for the processing of dairy products.

Nevertheless, the mainstay of Idaho's Food Processing sector remains to be vegetable and fruit processing of which frozen or dehydrated potato products account for the majority output. Within this sub-category of the Food Processing industry nearly every major food industry conglomerate is represented in Idaho: Lamb-Weston (ConAgra), Ore-Ida Foods (H.J. Heinz), French's (Borden), and the J.R. Simplot Company.

However, Idaho also experienced employment cutbacks and the closure of some food processing plants in the 1990's: the Del Monte plants in Burley and Franklin, Idaho and the Pet Milk/B&M Baked Beans plant in Buhl, Idaho, plus the closure of the Ore-Ida Foods headquarters in Boise. Furthermore, the marketplace had in the late 1990s through 2000 had revealed signs of weakness in the demand for frozen processed potato products. Employment cutbacks occurred at the J.R. Simplot potato processing plants in Caldwell, Idaho. And Simplot closed it's processing plant in Heyburn, Idaho. In addition, in the recent past Ore-Ida Foods sold a portion of its Idaho potato processing facilities to a Canadian food products company.

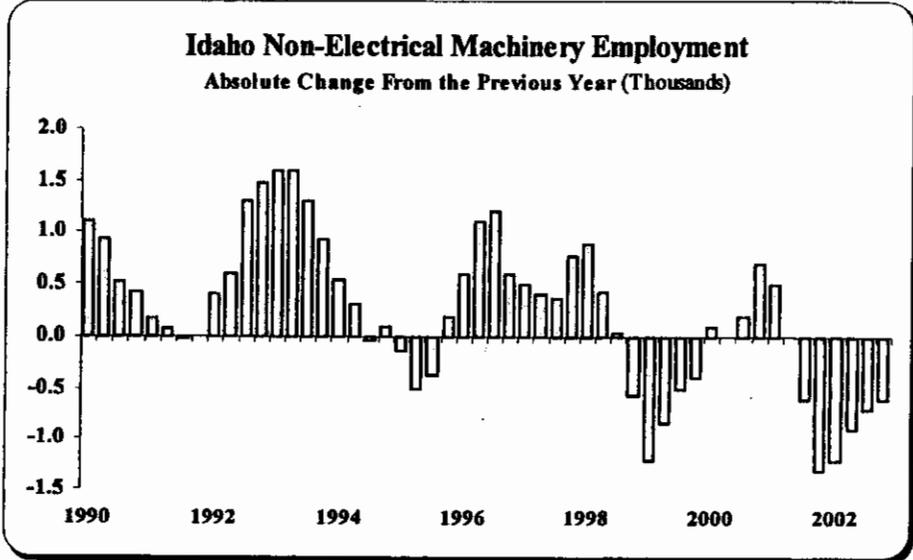

In the years 1994 and 1995 food processing employment in the state fell 3.2% and 2.8% respectively. The industry made a modest employment turnaround in 1997 and 1998 with a statewide gain of 100 jobs (0.6%). But, the closure of Ore-Ida Food's headquarters in Boise during 1998 produced additional employment losses in the Food Processing industry. In the next two years produced a modest gain of 100 jobs statewide in 1999 and a loss of 200 Food Processing jobs in 2000. Idaho's Food Processing sector held employment levels steady in 2001, but gave way to a 1.9% loss, about 330 jobs, in 2002. At year-end 2002 nearly 17,000 people were employed in Idaho's Food Processing industry.

In the near-term further job losses due to the continuing process of the closing the J.R. Simplot plant in Heyburn, Idaho will lead to the further loss of jobs in the industry.

In the 2003 Economic Forecast, employment in Idaho's Food Processing industry is expected to decrease slowly at an annual average rate of 0.1% per year over the 2000 to 2025 period.

Idaho's high-tech manufacturing industries – Non-electrical Machinery and Electrical and Electronic Equipment manufacturing have not been immune from the current economic slowdown.

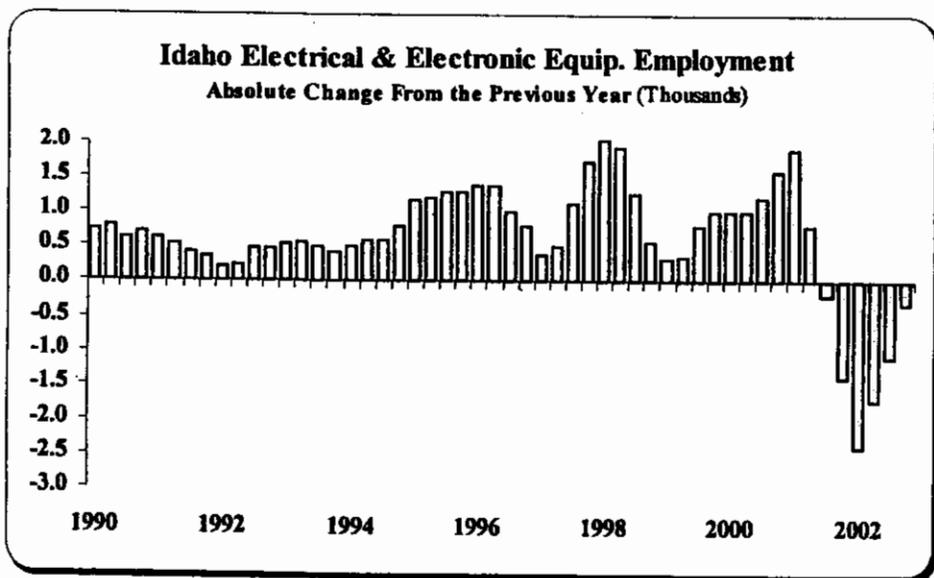

During the six years, 1992 through 1998, employment in Idaho's non-electrical machinery manufacturing industry increased by nearly 4,000 jobs. However, Non-electrical Machinery employment growth has stumbled since 1999. Financial troubles, employment cutbacks, and the subsequent sale of Micron Custom Manufacturing and Micron Electronics in Nampa, Idaho partially accounted for the job losses. In addition, a corporate restructuring at Boise Hewlett-Packard plant caused some additional job losses. Today, the national economic recession has further depressed non-electrical machinery employment in the state. In 2001, employment in Idaho's Non-electrical Machinery manufacturing sector declined by 3.8%. This was followed by a much more pronounced 8.4% loss in employment in 2002. At year-end 2002 there were 8,700 people employed in Idaho's Non-electrical Machinery manufacturing sector – nearly 2,200 less people than at year-end 2000.

Electrical and Electronic Equipment manufacturing in Idaho had, until recently, maintained more consistent levels of employment than the Non-electrical Machinery manufacturing industry. However, that is now changing.

Electrical and Electronic Equipment manufacturing in Idaho increased in every year of the 1990s. The industry added nearly 8,900 jobs to the state's payrolls in the period 1990 to 2001. Idaho's employment in the industry increased at a 9.0% annual average rate from 1990, when employment in the industry averaged 5,600 jobs, to its most recent peak level of employment (14,500 jobs) in 2001.

However, the national economic recession and the meltdown of the telecomm/.com "new economy" has taken a toll on Idaho's Electrical and Electronic Equipment industry. From a peak level of employment of 15,500 in the first quarter of 2001, employment in Electrical and Electronic Equipment manufacturing statewide had declined by nearly 1,400 jobs at year-end 2002 - a 15.5% loss in two years. The recent closure of the Jabil Circuit plant in Meridian, Idaho, and the announced employment cutbacks and eventual closure of the Zilog plant in Nampa, Idaho indicated that the prospects were poor for a near-term turnaround in the industry.

But, the announcement that Micron Technology in Boise would layoff nearly 10 percent of its workforce worldwide brought any hopes of a near-term economic turnaround in the Idaho economy to a halt. Micron Technology will release nearly 1,100 employees at its Boise plant. With the closure of the Zilog plant in Nampa the state could easily experience the loss of another 1,300 - 1,400 jobs (another 10.5%) in the Electrical and Electronic Equipment manufacturing industry over the next six to nine months. If that were the case Idaho will have experienced nearly a 24% decrease in what had been its fastest growing manufacturing industry.

The 2003 Idaho Economic Forecast predicts that Electrical and Electronic Equipment employment in the state will decline to nearly 11,800 jobs in 2004 before beginning a renewed phase of employment gains. Thereafter, the economic forecast predicts that Electrical and Electronic Equipment employment in the state will resume its upward momentum. But, at a much more subdued pace than has been the state's historic experience. Idaho employment in Electrical and Electronic Equipment manufacturing is expected to reach nearly 18,600 in the year 2025. This represents a 1.1% annual average rate of employment gains over the 2000 to 2025 period.

The outlook for the Non-electrical Machinery and Electrical and Electronic Equipment manufacturing industry in the state is also more subdued than in prior forecasts. Idaho employment in the Non-electrical Machinery manufacturing industry is expected to reach 13,300 jobs in the year 2025 - an annual average rate of growth of 1.0% per year over the period 2000 to 2025.

Transportation Equipment manufacturing in Idaho largely consists of the production of recreational vehicles and the rebuilding of railroad engines. The industry added nearly 1,100 new jobs to the state's employment rolls in the 1990's. Nevertheless, the economic pressures of the current national recession have caused Idaho employment in Transportation Equipment manufacturing to decrease by close to 300 jobs during the past two years.

In the 2003 Economic Forecast, the Transportation Equipment manufacturing sector in Idaho is expected to regain some of the employment lost due to the national recession. However, in the longer-term employment in Transportation Equipment manufacturing statewide is expected to slowly decrease by an annual average rate of 0.4% per year over the 2000 to 2025

period. The end result being that Idaho employment in Transportation Equipment manufacturing will be only about 200 jobs higher in the year 2025 than they are today.

During the 1990s Idaho's smaller manufacturing industries did not, in total, significantly add to the state's overall manufacturing employment rolls. Those manufacturing sectors that are forecasted in the 2003 Idaho Economic Forecast include: Paper and Allied Products, Chemicals and Allied Products, the Printing and Publishing industry, Fabricated Metal Products, and Stone, Clay, and Glass Products manufacturing.

The Paper and Allied Products industry in the state has experienced a modest downturn in employment with the national recession -- a loss of about 200 jobs from year-end 2001 to year-end 2002. Over the past decade employment in the Paper and Allied Products industry in Idaho has averaged nearly 2,200 jobs. In total the industry has posted an overall loss of 400 jobs since the start of the 1990s. In the 2003 Idaho Economic Forecast Paper and Allied Products employment in Idaho is expected to fluctuate slight up and down over the forecast period, but by the year 2025 be virtually the same as it is today.

Nearly 2,000 people were employed in Idaho's Chemical and Allied Products manufacturing sector at the end of 2002. This represents a loss of nearly 300 jobs in Idaho's chemicals industry. The recent closure of the Astaris elemental phosphorus plant in Pocatello accounts for the majority of these job losses. Those jobs are not likely to return. In the 2003 Idaho Economic Forecast employment in the Chemicals and Allied Products industry is not expected to surpass the 2,000 jobs that the industry currently represents in the state.

Employment in Idaho's Printing and Publishing industry stood at 5,000 jobs at year-end 2002. Over the past two years employment in the industry has declined by nearly 450 jobs. In the 2000 to 2025 period of the economic forecast Idaho employment in the Printing and Publishing Industry is expected to increase at an annual average rate of 0.2% per year.

The Fabricated Metals manufacturing industry had produced notable employment gains through the mid-1990s. However, since 1997, and through 2001, Fabricated Metals manufacturing employment in Idaho had averaged 3,000 jobs, with very little variation. In 2002, the pressures of the slowdown in the national and local economies caused the loss of nearly 200 jobs

statewide. The 2003 Idaho Economic Forecast projects that Idaho employment in Fabricated Metals manufacturing will increase at an annual average rate of 0.5% per year during the 2000 to 2025 forecast period. Nevertheless, the industry is slated to post an overall net gain of 420 jobs from today's level of employment.

Employment in Stone, Clay, and Glass Products manufacturing in Idaho increased by nearly 500 jobs in the 1990s to reach its current level of nearly 1,570. In the 2003 Idaho Economic Forecast employment in Idaho Stone, Clay, and Glass Products manufacturing is predicted to increase to nearly 1,770 jobs in the year 2025 — an annual average increase of 0.7% per year over the 2000 to 2025 forecast period.

In the category of "other manufacturing", the location of a large office furniture manufacturing facility in Post Falls, Idaho has improved the outlook for the furniture industry in the state. However, the national economic slowdown caused some employment losses in the state's furniture industry. It is expected that as the national economy recovers and business investment increases, the furniture manufacturing industry in Idaho will return to the employment levels that were achieved prior to this current recession.

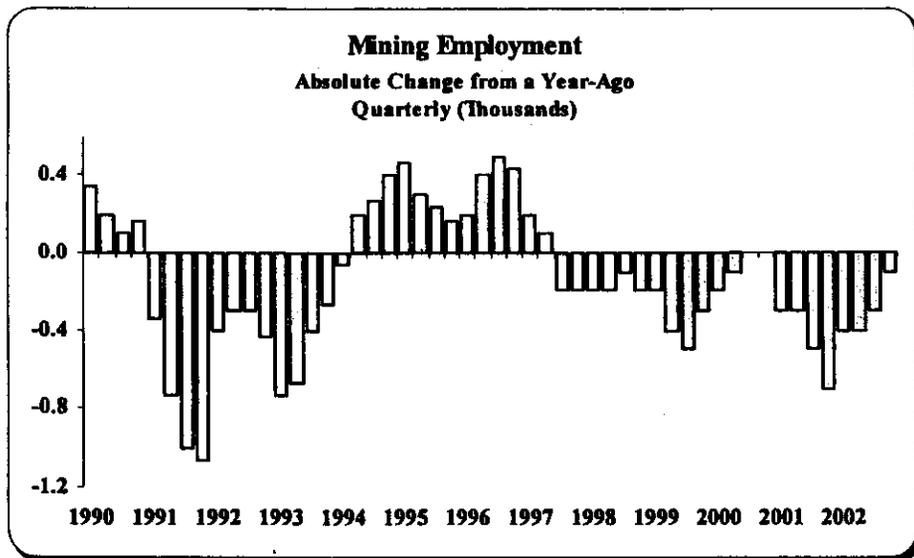

The previously mentioned smaller Idaho manufacturing industries are not expected to experience major employment gains in the 2000 to 2025 forecast period of the 2003 Idaho Economic Forecast.

In summary, the 2003 Idaho Economic Forecast predicts that total manufacturing employment in Idaho will increase from the year-end 2002 level of 71,000 jobs, to nearly 82,800 jobs in the year 2025. This growth represents an absolute increase in manufacturing employment of nearly 11,800 jobs and an annual average rate of growth of 0.3% per year.

Again this updated forecast represents a lowering of expectations for future employment growth in Idaho's manufacturing industries. The Idaho Economic Forecasts of the two previous years predicted that manufacturing employment in the state would increase at annual average rates of 1.1% and 1.3% per year, respectively, over the forecast period. Nationally, manufacturing employment is expected to decrease at an annual rate of 0.3% per year over the 2000 to 2025 period.

### Mining and Agriculture:

Employment in Idaho's of Mining industry has been on a slow downward trend since the early 1980s. Nevertheless, the industry will occasionally exhibit periods of increased activity and some gains in employment, such as in the years 1994 through 1997, only to give way to the economic gravity of marketplace. In the most recent cycle, Idaho's mining industry has experienced a sustained contraction in employment and output. This contraction began in 1997 and has prevailed, thus far, through year-end 2002. In that period nearly 1,300, or 42% of the total, mining industry jobs have been lost in the state. Today, low silver prices continue to challenge the economic viability of the remaining Idaho silver mines. And, while gold prices have soared after the terrorist attacks of 9/11 they have not provided the

needed momentum to spur on new development or to reopen previously mothballed facilities.

In the near to intermediate term future, a continuation of the market conditions that have produced low silver and gold prices is the most likely scenario. This will keep many of Idaho's precious metal mines at minimum levels of production and will dictate the closure of still others. Without higher

silver prices or the discovery of more productive ore bodies mining activity will not be able to contribute significantly to future employment gains. In addition, the closure of the Astaris (formerly FMC) elemental phosphorus plant in Pocatello will depress demand for the phosphate ores that are mined in Eastern Idaho.

Mining employment in the 2003 Idaho Economic Forecast is expected to decrease to nearly 1,560 jobs in the year 2025 --- an annual average decrease of 1.7% per year over the 2000 to 2025 period. But, because of the current depressed state of the Mining industry in the state, the projected employment in 2025 is only 100 jobs lower than employment at year-end 2002.

In the 2003 Idaho Economic Forecast agricultural employment in Idaho is expected to continue to contract through the forecast horizon. The majority of the state's agricultural employment is directly related to the farming of agricultural crops. That segment, farm employment, is predicted to continue its contraction as it has done over the past twenty-five years. The majority of the employment losses in agriculture are the direct result of the strong productivity gains that have occurred on the farm. Truly, past agricultural employment losses are not an indication of a decline in Idaho's agricultural output, but are an indication of increased output per agricultural worker. This phenomenon is not unique to Idaho. Nationally, farm employment has in the past declined at a faster rate than that in Idaho. Again these job losses are largely the result of gains in labor productivity outstripping the growth in agricultural output.

However, total agricultural employment, which in addition to direct farm employment includes jobs in the other agricultural industry categories of agricultural services, forestry, and fisheries which have remained relatively constant over the past two decades.

The underlying reason that total agricultural employment in Idaho has been able to maintain a high degree of employment stability over the past twenty years, in spite of declines in farm employment, are the strong job gains within the Agricultural Services sub-sector. Agricultural services includes employment in the fast growing and usually very urban jobs of lawn care; lawn fertilizing services, lawn seeding, spraying, and/or mowing services as well as the sod laying and turf installation. This sub-sector of the

agricultural industry has experienced increased employment over the past twenty years, and it is the one area of agriculture that will most likely see overall employment growth in the future.

In the 2003 Idaho Economic Forecast agricultural employment in the state is expected to decrease at an annual average rate of 0.9% per year over the 2000 to 2025 period. This outlook is consistent with forecasts agricultural employment in the nation. Nationally agricultural employment is expected to lose nearly 100,000 jobs by the year 2025 from 2002 employment levels.

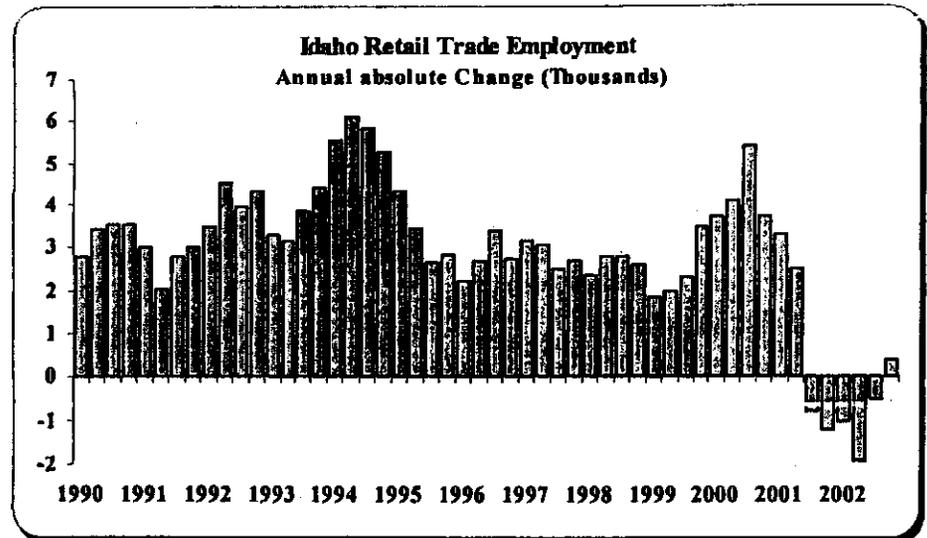

**Secondary Industry Employment:**

The "secondary industry" employment categories of Wholesale and Retail Trade, Finance, Insurance and Real Estate, Contract Construction, and Services are expected to provide the majority of Idaho's future employment growth. Traditionally these are viewed as "local serving" industries. That is they are serving a local population and are not usually thought of as exporting goods and/or services outside of the local area. In most cases this view does not match the reality of today. There are many examples of employment that is classified within the Communications, Finance, Insurance, Trade, and Service industries that are serving a multi-state/regional or national market. The call centers of Direct TV, Sears Credit, and CapitalOne Bank are just a few examples facilities with these regional/national service areas that are classified as "local serving".

Idaho employment in Wholesale and Retail Trade is predicted in the 2003 Idaho Economic Forecast to increase from its 2002 average of 140,000 jobs statewide, to nearly 217,000 in the year 2025 - an annual average increase of 1.9% per year. This outlook, in terms of the annual average percentage growth in employment is slightly higher than the expectation of the 2002 Economic Forecast. This phenomenon is mostly due to the fact that the current recession brought Trade industry employment in the state to levels lower than were previously expected. Therefore, a recovery from the recession will bring about stronger rates of growth in the near-term. Nationally, employment in the Trade industries is expected to increase at an annual average rate of 0.6% per year over the period.

Since the beginning of 2001 the pace of Idaho's Wholesale and Retail Trade employment growth lost momentum as the national economy

slipped into recession. In 2000 Idaho employment in Wholesale and Retail Trade increased by 3.0%, about 4,800 jobs. During 2001 the industry was able to post employment gains in the first and second quarters of the year, but trade employment fell in the third and fourth quarters of the year. Nevertheless, for the year 2001, trade employment in the state, on average, held steady with year 2000 levels at 141,000 jobs. In 2002, Wholesale and Retail Trade employment in the state continued to soften further with additional employment losses in the first three quarters of the year. At year-end 2002 Trade industry employment in the state was off nearly 1,200 jobs - down 0.3% - from 2001 levels.

Idaho employment in the food stores sub-category of Wholesale and Retail Trade has fallen by nearly 1,800 jobs during the past two and one-half years - from 20,200 in the third quarter of 2000, to 18,400 jobs in the fourth quarter of 2002. Nearly one-half of those job losses were experienced in the Boise MSA and may be attributable to corporate restructuring and employment cutbacks at the Albertson's headquarters in Boise.

In the economic forecast Idaho Wholesale and Retail Trade employment is expected to increase from 140,000 jobs in 2002, to nearly

217,000 jobs in the year 2025 — an annual average increase of 1.9% per year over the 2002 to 2025 period.

The Finance, Insurance, and Real Estate (FIRE) industry in Idaho experienced strong growth in the first half of the 1990s. In the years 1990 to 1997, FIRE employment statewide increase by nearly 5,500 jobs - an annual average increase of 3.6% per year. However, many factors came together in the late 1990s to put a chill on the industry's employment gains. Banking industry restructuring and mergers, a slower rate of economic growth in Idaho, and, at the time, higher interest rates that eroded the pace of new home purchases and the refinancing of mortgages on existing homes all contributed to slower employment growth in the final years of the 1990's. Idaho's Finance, Insurance, and Real Estate employment averaged 23,500 in 2000. This was a modest decrease of nearly 100 jobs, 0.4%, from 1999 employment levels. The Finance, Insurance, and Real Estate sector regained some upward momentum in 2001 and 2002 as the Federal Reserve Bank cut interest rates. This action spurred a new round of housing construction and mortgage refinancing in the state and the nation. At year-end 2002, FIRE employment in Idaho was 24,800 – a gain of 1,300 jobs from 2000 levels.

In the 2003 Idaho Economic Forecast employment in Idaho's Finance, Insurance, and Real Estate industry is expected to increase from its current level of nearly 24,800 jobs to nearly 33,000 jobs in the year 2025. This represents an annual average percent growth of 1.0% per year. Nationally, Finance, Insurance, and Real Estate employment is expected to increase at an annual average rate of 0.8% per year over the same time period.

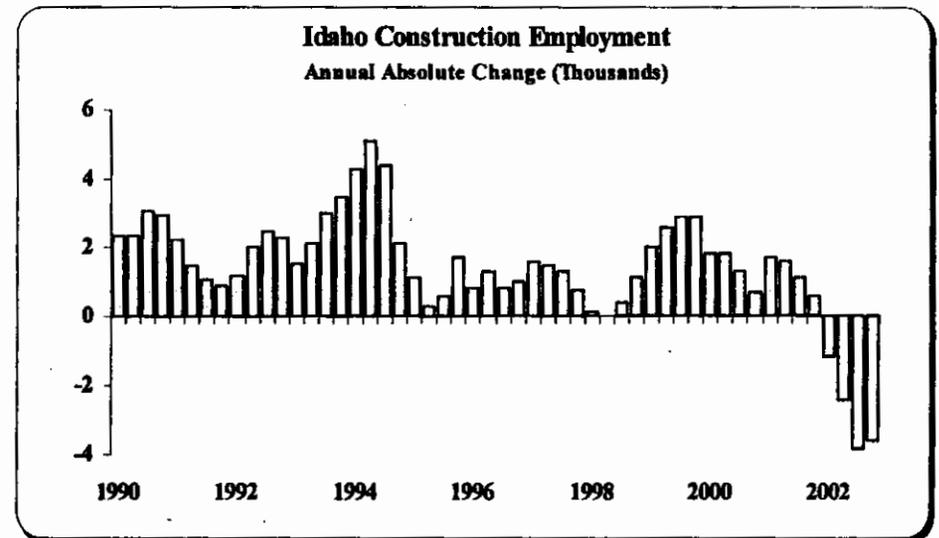

Idaho employment in the Construction industry increased by nearly 18,100 jobs in the 1990's – a very strong annual average percent increase of 7.4% per year. With annual average increases in Construction employment ranging from 7.4% to 16.2% per year in the 1990s, Idaho was able to maintain a position in the top tier of the national rankings for construction industry job growth.

Building permit activity in Idaho during the years 1986 to 1990, and 1992 to 1994, exceeded each prior year. The only exception was 1991, the year of the last national recession, did Idaho's building permit figures not exceed the prior years. In 1999 and 2000 residential building permit activity in Idaho slowed in response to higher interest rates. Nevertheless, employment

in the construction industry did not fall off primarily due to an increase in commercial and infrastructure construction projects, which offset the slower pace of residential construction activity.

In 2001 and 2002, lower mortgage interest rates injected renewed strength into residential construction, but in total it was not enough to overcome the effects of a softening economy. Throughout 2002, Construction industry employment in Idaho slid in each quarter of the year – from a decrease of 3.6% from prior year levels in the first quarter of 2002, to an 11.0% decrease in the fourth quarter. At year-end 2002 Construction industry employment in the state was off nearly 4,000 jobs from year-end 2001 employment levels.

Construction employment in the 2003 Idaho Economic Forecast is expected to increase from an annual average of 34,700 in 2002 to nearly 43,200 in the year 2025 – this represents an annual average percent increase of 1.0% per year. Nationally, construction employment is expected to increase at an annual average rate of 1.6% per year over the forecast period.

In the 1990s Idaho gained nearly 8,100 jobs in the Transportation, Communications, & Utilities (TCU) industries -- from an annual average of

19,800 jobs in 1990 to 27,900 jobs in 2000. The 3.5% per year annual average increase in Idaho TCU employment posted in the decade of the 1990s was unprecedented for the state. But, the period was not without its bumps in the road.

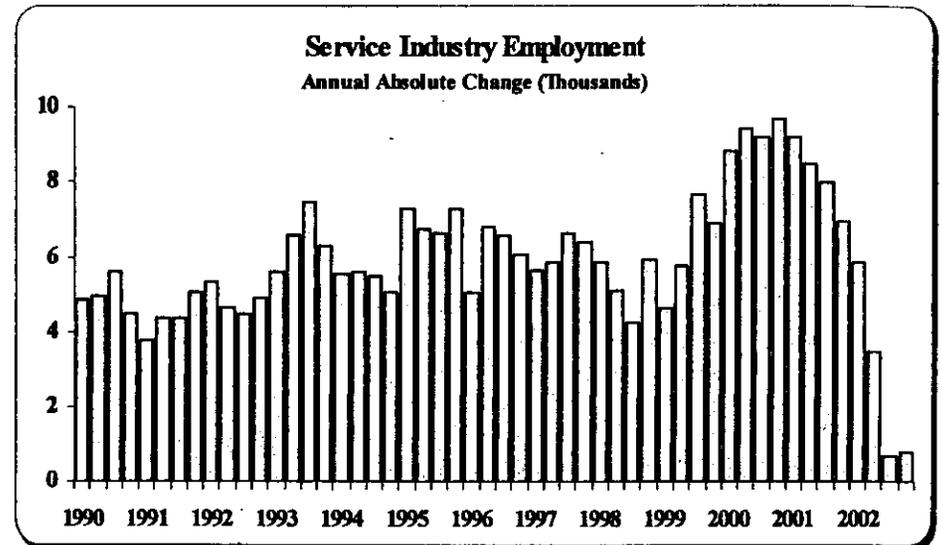

In railroad transportation sector the 1990s was the decade of industry restructuring activity and the merger of the Union Pacific and Southern Pacific railroads. These events caused the loss of nearly 500 jobs in Idaho's railroad transportation industry in the 1990s. Concurrently, employment in Idaho's trucking and warehousing industry increased by nearly 2,500 jobs more than offsetting the losses in railroad transportation. However, the transportation sector was not the cause of remarkable TCU employment gains in the 1990s.

The communications industry deserves that distinction. The employment gains in Idaho's communications sector during the late 1990s and through the year 2000 was remarkable. In 1997, communications sector employment statewide increased by 8.1%. It was followed by a 25.0% increase in 1998, 18.0% in 1999, and 6.4% in 2000. The majority of these job gains occurred in the Boise MSA. But, it wasn't to last.

The events of the past two years have not been kind to the state's Transportation, Communications, and Utilities sector. The collapse of many .com firms, the overbuilding of capacity and the subsequent market implosion of the communications industry, the economic recession, and the terrorist attacks of 9/11 all took a toll on the Transportation, Communications, and Utilities sector. Starting in the third quarter of 2001 TCU employment in Idaho posted a modest decrease from prior year levels. Since that time TCU employment statewide has remained below year-ago levels in each calendar quarter. In the second half of 2002 Idaho TCU employment was off nearly 650 jobs from the levels experienced at the same time in 2001.

In the 2003 Idaho Economic Forecast TCU employment in Idaho is expected to increase by 6,500 jobs, from an annual average of 27,500 in 2002 to nearly 34,000 in 2025 – an annual average percent increase of 0.8% per year over the period.

Historically employment in Idaho's Service industries has not exhibited the same degree of sensitivity to local economic conditions, as have many of the other secondary industries. During the 1980-1982 recession Service industry employment in Idaho lost only 700 jobs.

An examination of the types of firms within the Service sector provides clues to the industry's resilience.

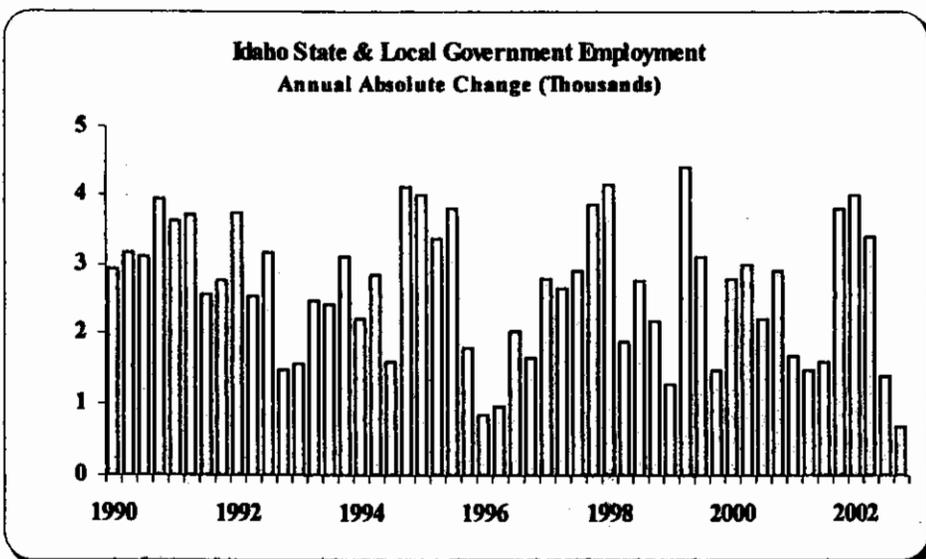

The largest sub-category of Service industry employment in Idaho is Health Services. It accounts for close to 25% of total the Service industry employment in the state. In second and third place are the two Service industry sub-categories of Business Services and Engineering and Management Services. Recently, these two sub-sectors made up 20.0% and 12.5%, respectively, of the total Service industry employment in the state.

The most notable pace of Service industry employment growth in Idaho during the 1990s was in Business Services that increased at an annual average rate of close to 11.5% per year. At year-end 2002 Idaho employment in the Health Services, Business Services, and the Engineering and Management Services sectors stood at 40,700, 29,500, and 19,700 respectively, and accounted for close to 59% of total Service industry employment in the state.

A significant portion of the state's Engineering and Management Services employment is directly associated with the operation of the U.S.

Department of Energy's Idaho Nuclear and Environmental Laboratory (INEEL) in Eastern Idaho. Idaho employment in the Service industry sub-sectors of Personal Services and Hotels and Lodging Places peaked at 4,600 and 9,400 respectively in the second quarter of 2001 and the third quarter of 2000. However, statewide employment in these two industries has slipped as the national recession took hold. Idaho employment in Hotels and Lodging Places was off nearly 11.4% in the fourth quarter of 2002 from year earlier levels. But, Personal Services employment in the state had managed to post a modest gain in the last two quarters of 2002 after experiencing losses in the first half of the year.

In general, the Service industries have, during the last fifteen years, posted strong rates of employment growth, both locally and nationally. It is expected that this trend will continue in the future. In the forecast period – 2002 through the year 2025, the 2003 Idaho Economic Forecast predicts that service period industry employment in Idaho will increase by nearly 120,600 jobs — representing an annual average percent increase of nearly 2.6% per year. Nationally, Service industry employment is expected to increase at an average annual rate of 1.9% per year during the same period.

Government employment (state, local, and federal) in the state increased by nearly 27,200 jobs – a pace of 2.9% per year – in the 1990s. Virtually all of these gains were in State and Local government. Federal government employment in Idaho has remained nearly unchanged from its 1990 employment levels, with one exception. That exceptional period being in the year 2000, the year of the last U.S. Census, when federal employment increased due to the hiring of temporary census takers. While on average federal government employment has been nearly constant over the past fifteen years it can, at times, vary significantly from year to year. This is largely due to the high concentration of federal government lands in Idaho and the location of the National Interagency Fire Center in Boise. The year 2000 serves as a prime example. Because of severe forest fires in the Western U.S., federal employment in Idaho increased by nearly 2,000 during much of the summer of 2000. This was well above federal government employment during the summer of 1999 and as a result federal employment posted an 8.3% increase for the year 2000. These situations may or may not occur in the future.

In 2002 budget holdbacks due to a weakening of state tax revenues has curtailed the growth of State and Local Government employment in the state. At year-end 2002 state government employment was off 3.2% from year-end 2001 levels. And, since nearly 47% of state government employment in Idaho is within the Boise MSA, site of the state capitol, the majority of the employment cutbacks have been felt there. In the near-term the prospects are that state government may not be able to recoup these lost jobs for one to two years until the local economy recovers from the current slowdown and there is renewed vigor in the growth of state tax revenues.

**Total Non-Agricultural Employment:**

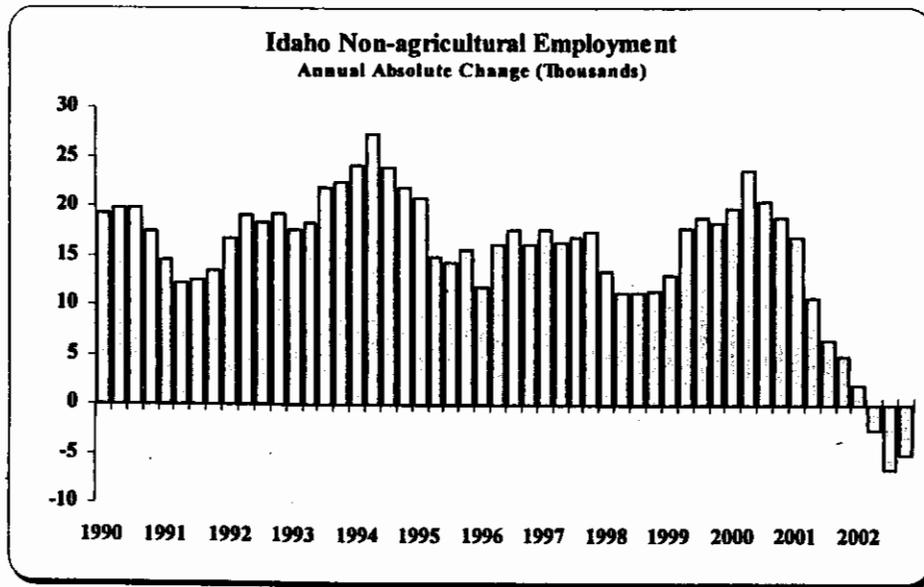

In the 1990s, total nonagricultural employment in Idaho increased by 45.4% –from a 1990 statewide figure of 384,900 nonagricultural jobs to an annual average in 2000 of 560,000 jobs – an absolute gain of 175,100 jobs representing an annual average increase of 3.8% per year. In comparison, nonagricultural employment in the nation increased at an annual average rate of 1.8% per year during the 1990s.

In addition, Idaho's non-ag employment gains in the 1990s tended to be more spatially concentrated than had been the case in either the 1970s or

1980s. Fully, 50% of Idaho's non-agricultural employment growth during the 90s was with the Boise MSA (Ada and Canyon counties). The Boise MSA posted nearly 85,000 new non-ag jobs during the 10-year period and maintained an annual average rate of employment growth of 5.0% per year over the decade.

Underlying that concentration was the "high-tech" job gains in Non-Electrical Machinery and Electric and Electronic Equipment manufacturing of which over 85% of Idaho's employment in these industries is concentrated in three counties – Ada and Canyon counties, plus Bannock County in Eastern Idaho. In addition, the 1990s also brought rapid growth to the service industries that are also concentrated in Ada County.

In the 2003 Idaho Economic Forecast, nonagricultural employment in the state is expected to increase at an annual average rate of 1.7% per year over the 2002 to 2025 period producing an absolute gain of nearly 269,000 additional jobs. However, the overall rate of employment growth in this year's economic forecast—1.7% per year – is below last year's outlook for nonagricultural employment in the state to increase at a 2.1% annual rate over the forecast period.

Total employment in Idaho, which differing from non-agricultural employment includes the jobs in Idaho's agricultural industry, is projected to increase at an annual average rate of 1.5% per year over the 2002 to 2025 period adding 257,300 jobs.

### Population

During the 1990s Idaho's population increased by nearly 287,000, from a population of 1,006,749 at the 1990 Census to 1,293,953 at the 2000 Census benchmark. Averaged over the decade population in Idaho increased at 2.54% per year during the 1990s – over twice the national pace of population growth of 1.24% per year. Idaho ranked as the sixth fastest growing state in the nation during the 1990s.

While population growth in the 1990s was strong they do not measure up to the pace the state experienced in the 1970s. During that decade Idaho's population increased at an annual average rate of 2.8% per year. Nevertheless, while the 1970s pace of population growth were strong, the absolute gains posted in the 1990s were larger.

In the 1980s population growth in Idaho slipped to annual average rate of 0.8% per year. The Idaho suffered through a severe economic downturn with the 1980 – 1982 recession. The 1980-1982 recession precipitated the closure of many of Idaho's manufacturing plants that were dependent upon the state's natural resources. Lumber mills, food processing plants, mineral and metal smelters, and mining operations all experienced plant closures in the 1980s. For some communities in the state the 1980s put them into an economic tailspin from which they have not yet recovered.

In total, Idaho experienced a net population out-migration in the first half of the 1980s.

Historically, Idaho has maintained a faster rate of population growth than the nation. One of the reasons for this better-than-average rate of population growth in the past is that Idaho had a relatively higher fertility rate than the nation. However, today the effects of this phenomenon are not as significant as they once were. Over the past fifteen years the birth rate in Idaho has fallen significantly. After decades of consistently higher birth and fertility rates (nearly 50% higher than the national rate in the early 1980s),

Idaho's birth rates fell to the point that they converged with the U.S. rate in 1988 for the first time. Since 1990, both the U.S. and Idaho birth rates have declined overall, with the U.S. rate decreasing at a faster pace. The Idaho birth rate has been slightly above the U.S. birth rate since 1992 – in the range of 15.7 to 16.0 live births per thousand of population versus a U.S. birth rate in the range of 14.5 to 14.7 births per thousand of population. Nevertheless, the number of births in Idaho has increased – from 18,000 per year in 1995 to nearly 20,000 per year in 2000. However, much of this increase can be directly attributed to Idaho's population growth during the last decade.

In the 1990s Idaho's faster rate of population growth was largely due to population in-migration. This migration was driven by the state's stronger economic growth, and the subsequent increased demand for labor by Idaho industries and, from the worker's viewpoint, the attraction of better employment prospects than those that may have been available in other parts of the region or nation.

In the 2003 Idaho Economic forecast fertility rates in Idaho are expected to remain near present levels and to follow projected national trends (downward). In the forecast years of 2002 to 2025 Idaho is, on average, expected to continue a net population in-migration with a annual average gain from in-migration of nearly 2,200 persons per year. However, the current economic slowdown in the state has erased most of the motivation for new in-migrants to Idaho. In the near term population gains in Idaho due to in-migration are likely to be very small.

In the 2003 Idaho Economic Forecast total population in Idaho is projected increase from an estimated 1,340,000 in 2002 to nearly 1,820,000 in the year 2025, an annual average percent increase of 1.3% per year. In comparison, population in the U.S. is expected to increase at an annual average pace of 0.8% per year over the 2002 to 2025 period. If the national forecast holds true, U.S. population would increase from a current level of nearly 280.7 million to nearly 338.2 million in the year 2025.

This year's Idaho population forecast anticipates that population growth in the state will be somewhat slower than in either of the two prior economic forecasts. This is the result of two factors: 1) The current economic slowdown in Idaho dampens the near-term pace of population in-migration to the Idaho and, 2) the 2003 Idaho Economic Forecast predicts that Idaho's

employment growth will occur at a slower pace than in previous forecasts. This, in turn, subdues future in-migration to the state and its subsequent "multiplier effects" on the state's economy.

The population figures for the state and each of the state's forty-four counties have been adjusted to reflect the 2000 benchmark. In addition, historic populations for the state and each of the counties were adjusted in the intercensal years, 1991 through 1999, to make them consistent with the 2000 Census. In the near future the US Census Bureau will provide "official" 1991 through 1999 intercensal population estimates for the state and each of its counties. When that information is available the historic state and county population figures will be revised to reflect those "official" estimates.

### Households

The number of households in an area or region is a key factor utilized by many businesses in making estimates of the current or future customer base that they may serve. Historically, in Idaho as well as in the nation, the rate of household formation has exceeded the rate of population growth. During the 1970s and 1980s an increasing divorce rate, in conjunction with a delay in the age of first marriage, spurred household growth. In this forecast no specific changes are assumed concerning these sociologic characteristics; i.e., divorce rates and age of first marriage are not assumed to move up or down. However, the forecast methodology does estimate changes in the rate of household formation due to changes in personal income growth. Briefly, this phenomenon is that increased rates of personal income growth, such as that which would occur in the more prosperous economic periods will cause an increased rate of household formation. Conversely, weaker personal income growth will cause the household formation rate to slow. This phenomenon is due to the increased propensity for young adults to leave home and form their own households or for some divorces to occur when the economy is strong and employment and income prospects are better. In periods of poor economic growth and/or recession the employment and income prospects lessen these tendencies and the household formation rate slows.

During the 1970s, Idaho experienced a strong 3.9% annual average percent increase in the number of households in the state. At the same time the number of households in the U.S. increased at a 2.2% annual rate. The

1980s brought a period of slower economic and population growth to Idaho. In turn the state's rate of household growth slowed to an average percent increase of 1.1% per year while the nation posted an annual average increase of 1.7% per year. However, the strong economic growth and population in-migration of the 1990s brought strong household growth back to Idaho. From 1990 to 2000 Idaho households increased by nearly 2.6% per year – producing an absolute gain of nearly 104,000 households.

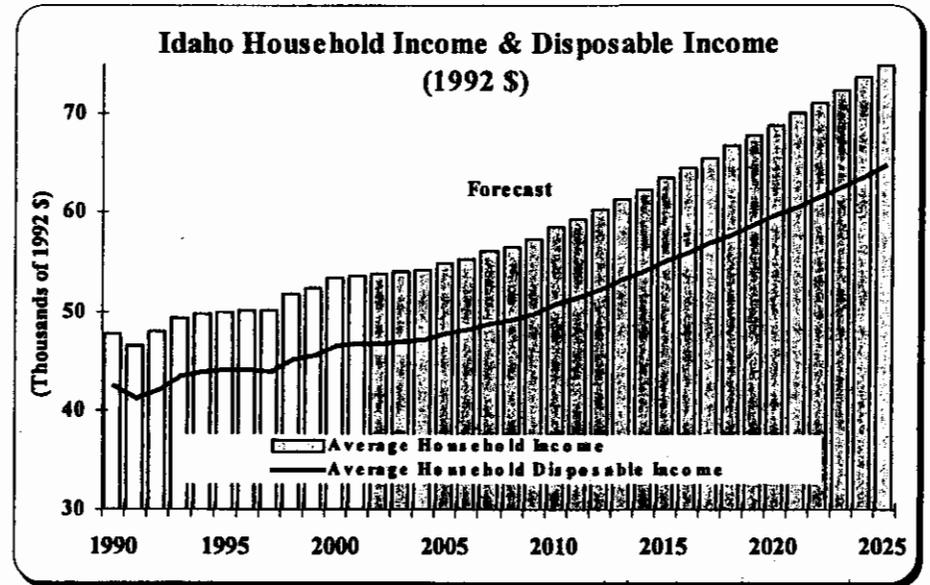

In 2003 Idaho Economic Forecast, the number of households in the state is expected to increase at an annual average rate of 1.6% per year, yielding an absolute increase of nearly 205,000 households statewide in the 2002 to 2025 forecast period. This predicted rate of household growth in Idaho is slower than the projected rates of 1.8% and 2.2% per year in the 2002 and 2001 Idaho Economic Forecasts, respectively. A portion of the expected lower household growth can be attributed to revisions associated with the Census 2000 benchmark of statistics for the number of households, persons per household, and group quarters populations. Lastly, the remaining portion of the slower household growth projection can be attributed to the effects of the current economic slowdown in the state's economy.

**Personal Income**

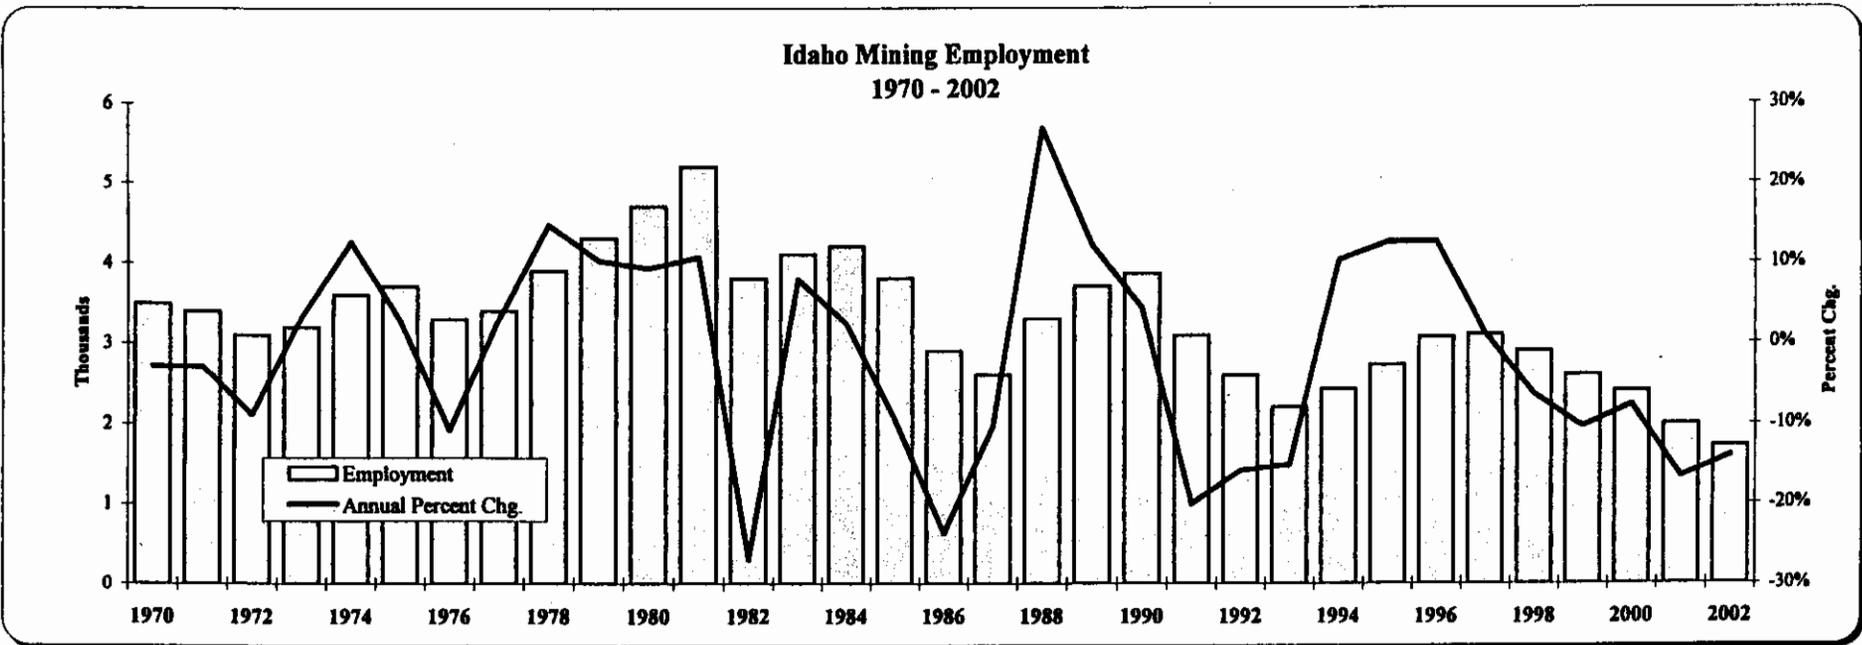

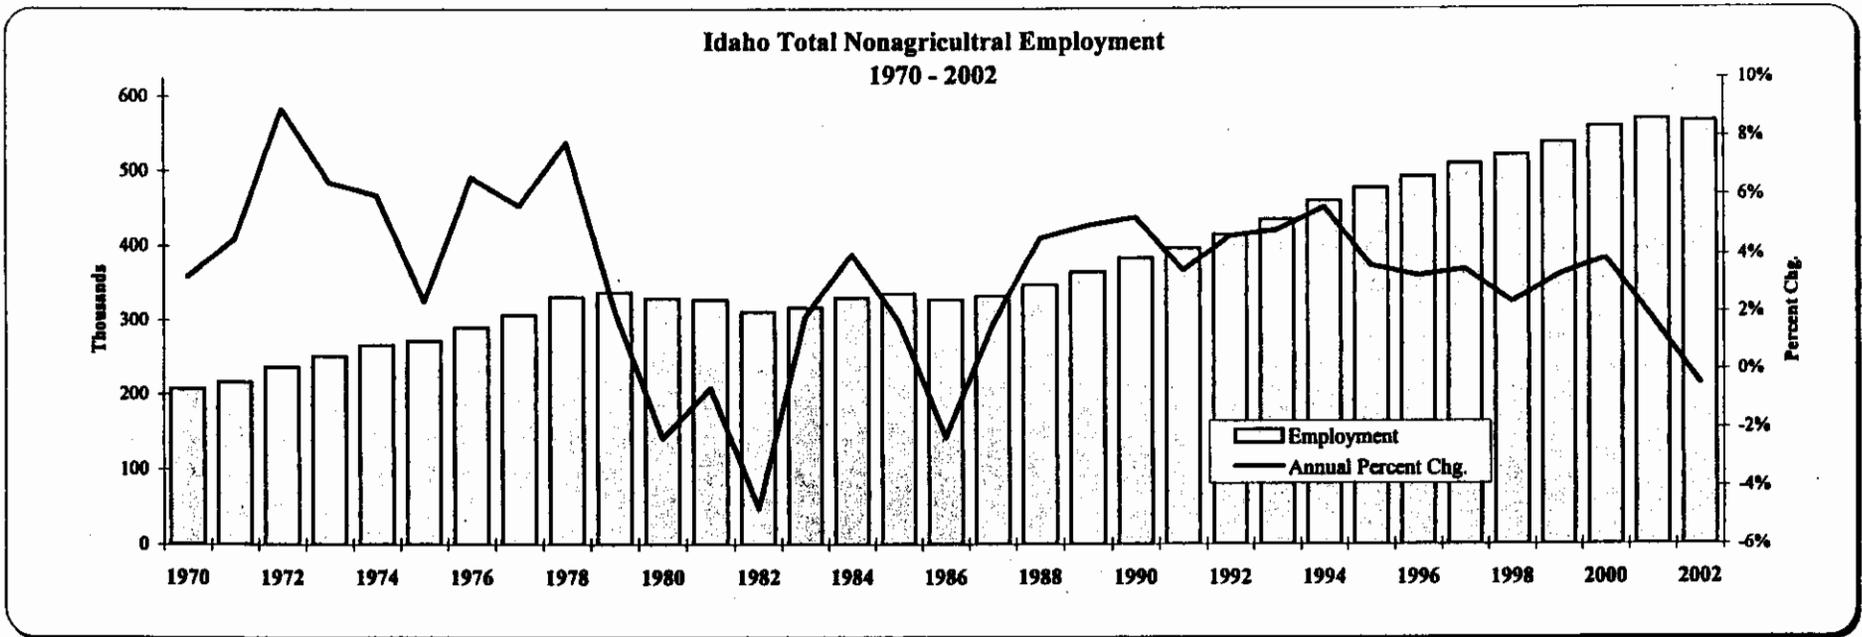

Idaho real personal income (personal income adjusted for inflation) is expected to increase at an annual average rate of 3.0% per year during the 2002 to 2025 period, with real per capita personal income increasing at an annual average rate of 1.6% per year. Nationally, total personal income growth is expected to increase at an average rate of 2.1% per year during the period, with per capita personal income posting gains of 1.5% per year.

While the long-term economic outlook for Idaho as presented in the 2003 Idaho Economic Forecast is lower than the prior year's forecast. The outlook for growth in Idaho real personal income is nearly unchanged. This circumstance is the result of some countervailing trends.

First, as the Idaho economy slows it necessarily follows that nominal personal income growth in the state would also slow. As a partial offset to that trend is the phenomenon that a slower growing Idaho economy acts a weaker attraction to new population in-migration – therefore lessening a downward pressure on personal income per capita. Further, a slowing economy, in most circumstances, produces a lower rate of price inflation. A lower rate of inflation softens the decline in real personal income and real per capita personal income. In the 2003 Idaho Economic Forecast the nexus of these three phenomena produce the unusual circumstance in which the expected real personal income and real per capita personal income growth are virtually unchanged from last year's forecast.

**Overview**

**of**

**The Economic Model**

### The Idaho Economic Forecasting Model

The Idaho economic and demographic forecasting model was completely revamped in 1997. This revision removed from the model the previously forecasted concepts of gross output by industry. Underlying this action, were the inherent statistical difficulties of using the gross output series in subsequent (recursive) equations and methodological uncertainties of using the Kendrix-Jaycox method of data construction. Today, the Idaho economic forecasting model uses personal income and employment by industry with increased importance. These are the main economic drivers of the forecast.

In addition, the forecasts of primary metals manufacturing employment, which were part of the forecast in the past, were also discontinued. Employment in primary metals manufacturing is currently too small to have a significant effect on overall employment in Idaho.

Forecasts of additional Idaho employment incorporated into the model revision are state government, local government, retail trade, wholesale trade, and medical services. Adding these sectors responds to interest expressed for these employment projections.

Lastly, the model was revised so that it will no longer automatically produce economic forecasts of the Idaho Power service area economy. Before the revision these projections were produced as an integral part of the overall forecast, and subsequently were shown in the economic outlook for the state of Idaho. Our findings were that forecasts of economic activity within the Idaho Power service area were of minimal interest to the public.

The economic forecasting model provides projections for Idaho employment by industry, average wages and salaries by industry, total wage and salary payments by industry, population by age cohort and sex, total labor force, and personal income by component. The historical databases of economic and demographic series utilized in the forecast process may be of monthly, quarterly, or annual frequency. The forecasts of economic and demographic series presented herein will be of annual frequency.

As is the case with any forecast, a great deal of judgement is necessary and all forecasted sectors are subject to review and possible modification.

The availability and utilization of this data at the state or county level should provide its users with a solid framework for increased accuracy in performing business planning, market evaluations, or corporate or agency budgeting.

The Idaho economic model is a simultaneous equation model, which uses forecasts of national inputs and demands for particular sectors of the Idaho economy having a national or international exposure. For example, the large majority of output from Idaho's electronics firms is not for consumption within Idaho. Rather, these products will be shipped to other areas for consumption and use. Production decisions of Idaho's electronics firms are driven by national product demand. Industries with these characteristics are often called basic industries. The economic model treats manufacturing, mining, agriculture, and the federal government sectors of the Idaho economy as basic industries. Furthermore, personal income from federal military duty within Idaho is treated as a basic industry, although the jobs are not classified in the state's total employment

Other industries not having a national profile and are local serving are referred to as secondary industries. For example, many firms provide products only into the local economy. Demand for these products is determined by local economic factors, rather than the national economy.

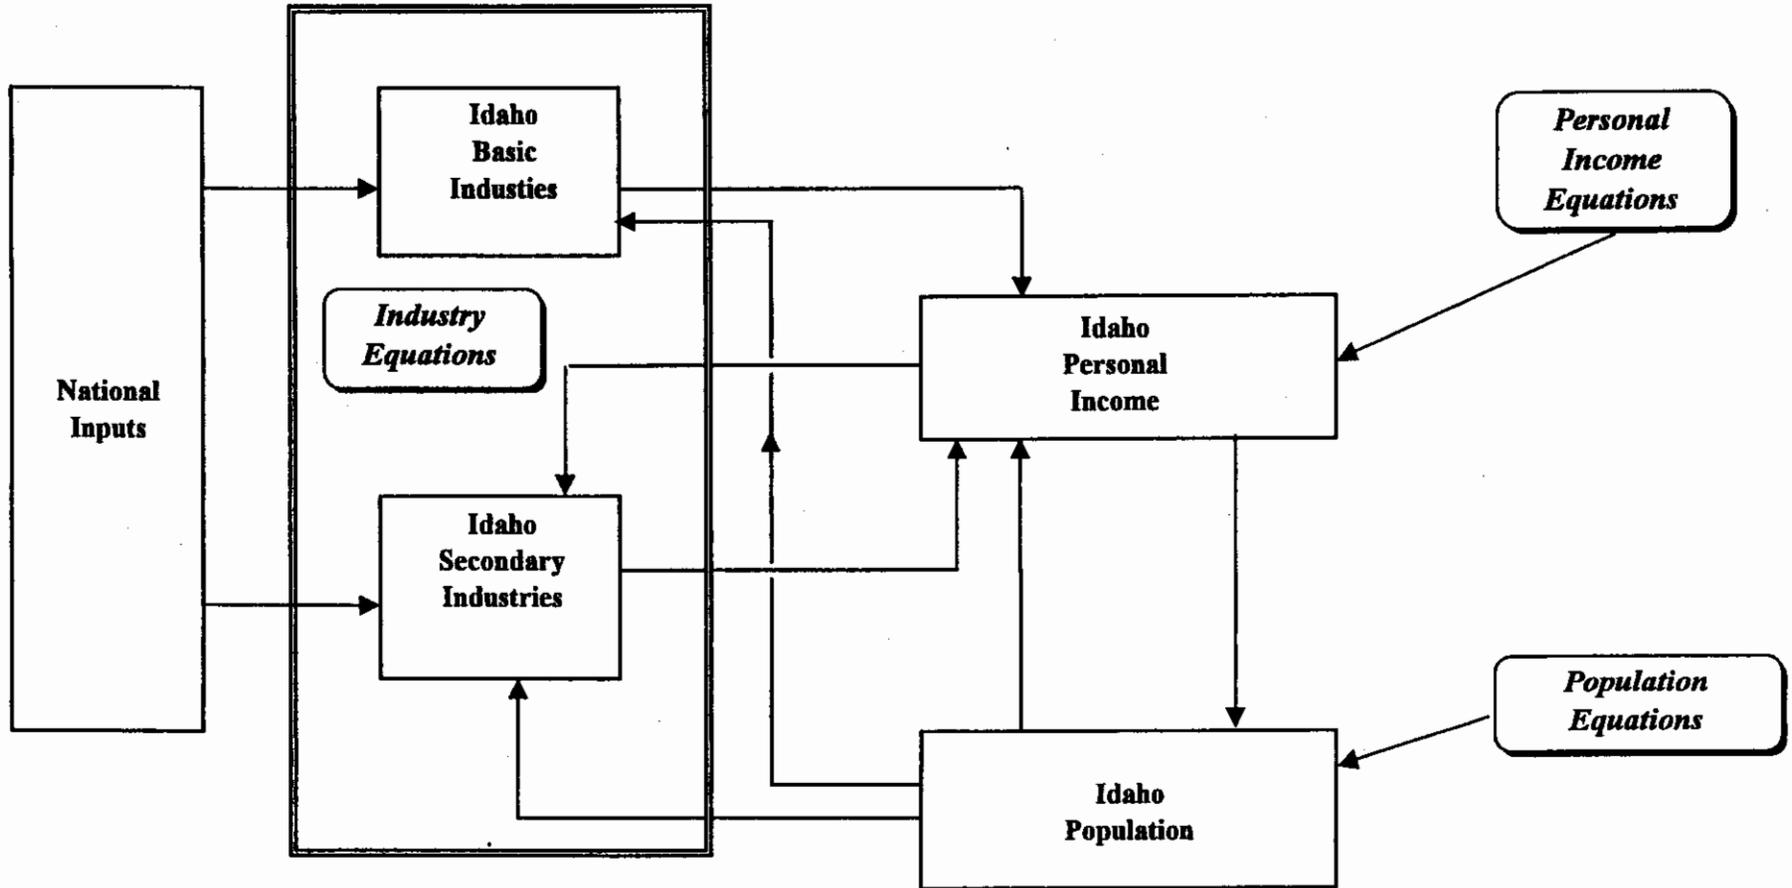

However, in recent years this basic industry/secondary industry distinction has blurred. Idaho's employment in facilities such as the Sears Credit Facility, Key Bank's consumer loan unit, Direct TV's customer service center, and CapitalOne all in Boise, would traditionally be classified as local serving, secondary industries. A closer examination of these operations would reveal that they are performing a business activity, very little of which is local serving. The geographic reach of these call centers is much wider, providing their company's services by interfacing with customers in all parts of U.S. Periodic monitoring of these types of 'back-room' facilities and their functions is used to monitor and maintain accuracy in the forecast.

The economic model makes a further distinction in attempting to model the factors that affect the location decisions of a firm or industry. When a firm evaluates a location for a plant, many cost factors are examined, taxes, energy costs, wages, and labor availability. Therefore, the model incorporates factors such as wage rates and energy costs that influence location choices.

Figure 1 presents an overview of the model structure. In the figure, a flow-chart depicts the interrelationships within the model shown as if broken into four large segments. Each segment is examined in additional detail below.

In reality, the model is not solved in distinct blocks, rather it is simultaneous with many equations dependent upon each other. In other words, the personal income equations are dependent upon the population, secondary

### Schematic Presentation of the Idaho Economic - Demographic Forecasting Model

and basic industry equations. And, in a like fashion, the secondary Industry equations are dependent upon personal Income and population.

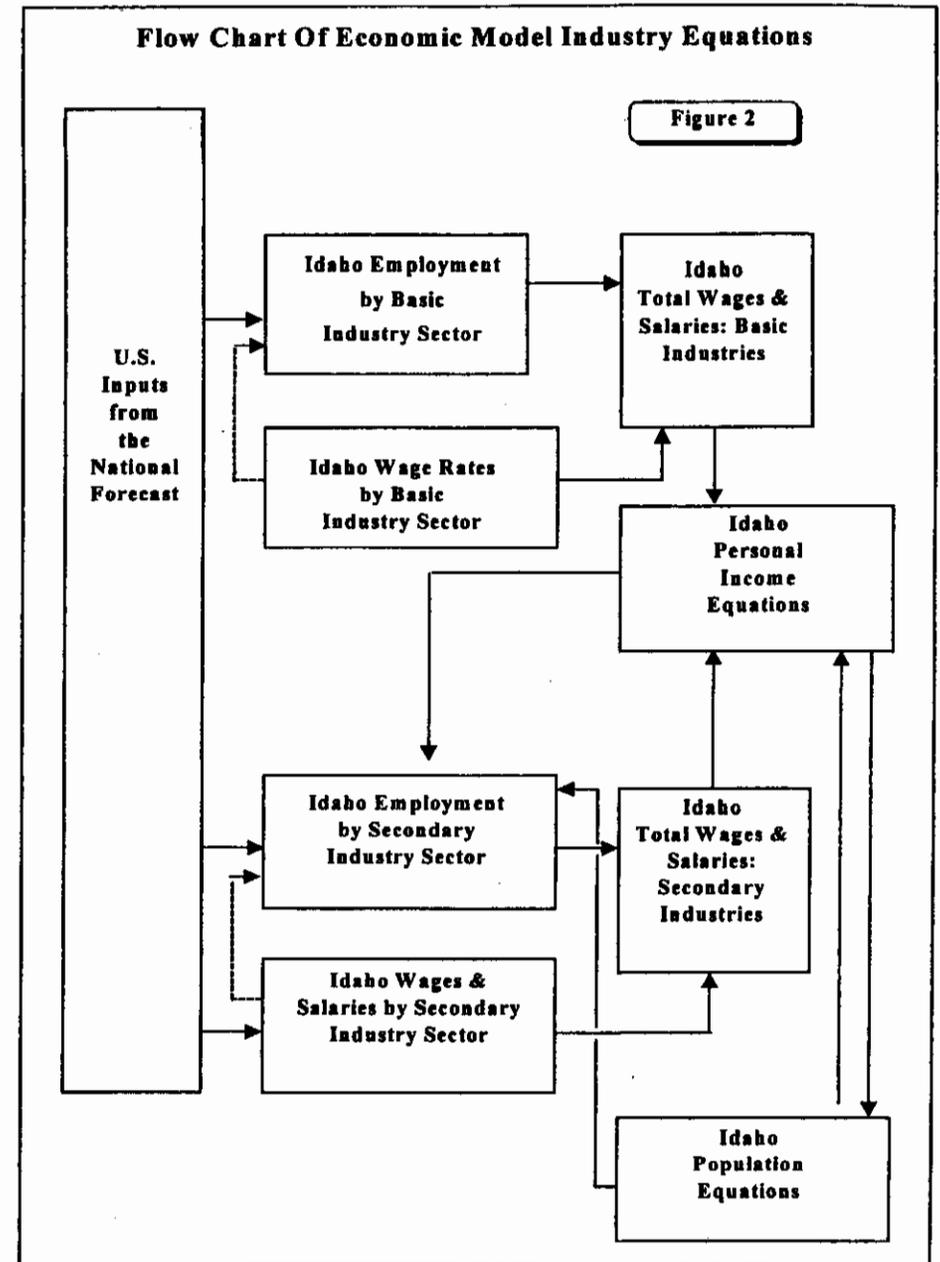

### **Industry Models**

The Idaho economic model industry equations relate national demand (an index of industry output) to local activity of the basic Industries. The secondary industries are a function of local product and service demand and are modeled as a function of Idaho disposable income per capita, Idaho population, and wage rates. (See Figure 2)

In Figure 2, demand for products and services from Idaho's basic industries are a function of national industry demand. In addition, Idaho wage rates by industry also are treated as a function of national wages in each industry. In turn, Idaho basic industry employment is a function of local output and wage rates. The agriculture and mining sectors of Idaho's economy could not be successfully modeled as a function of national activity measures. Although econometric methods were used for these sectors of the economy, the resulting forecasts were heavily managed with a degree of judgement. The agricultural industry forecast assumes that Idaho will maintain its historical share of national agricultural output. Implicit in that assumption is an outlook for additional agricultural productivity gains and slow or no growth in Idaho agricultural cropland.

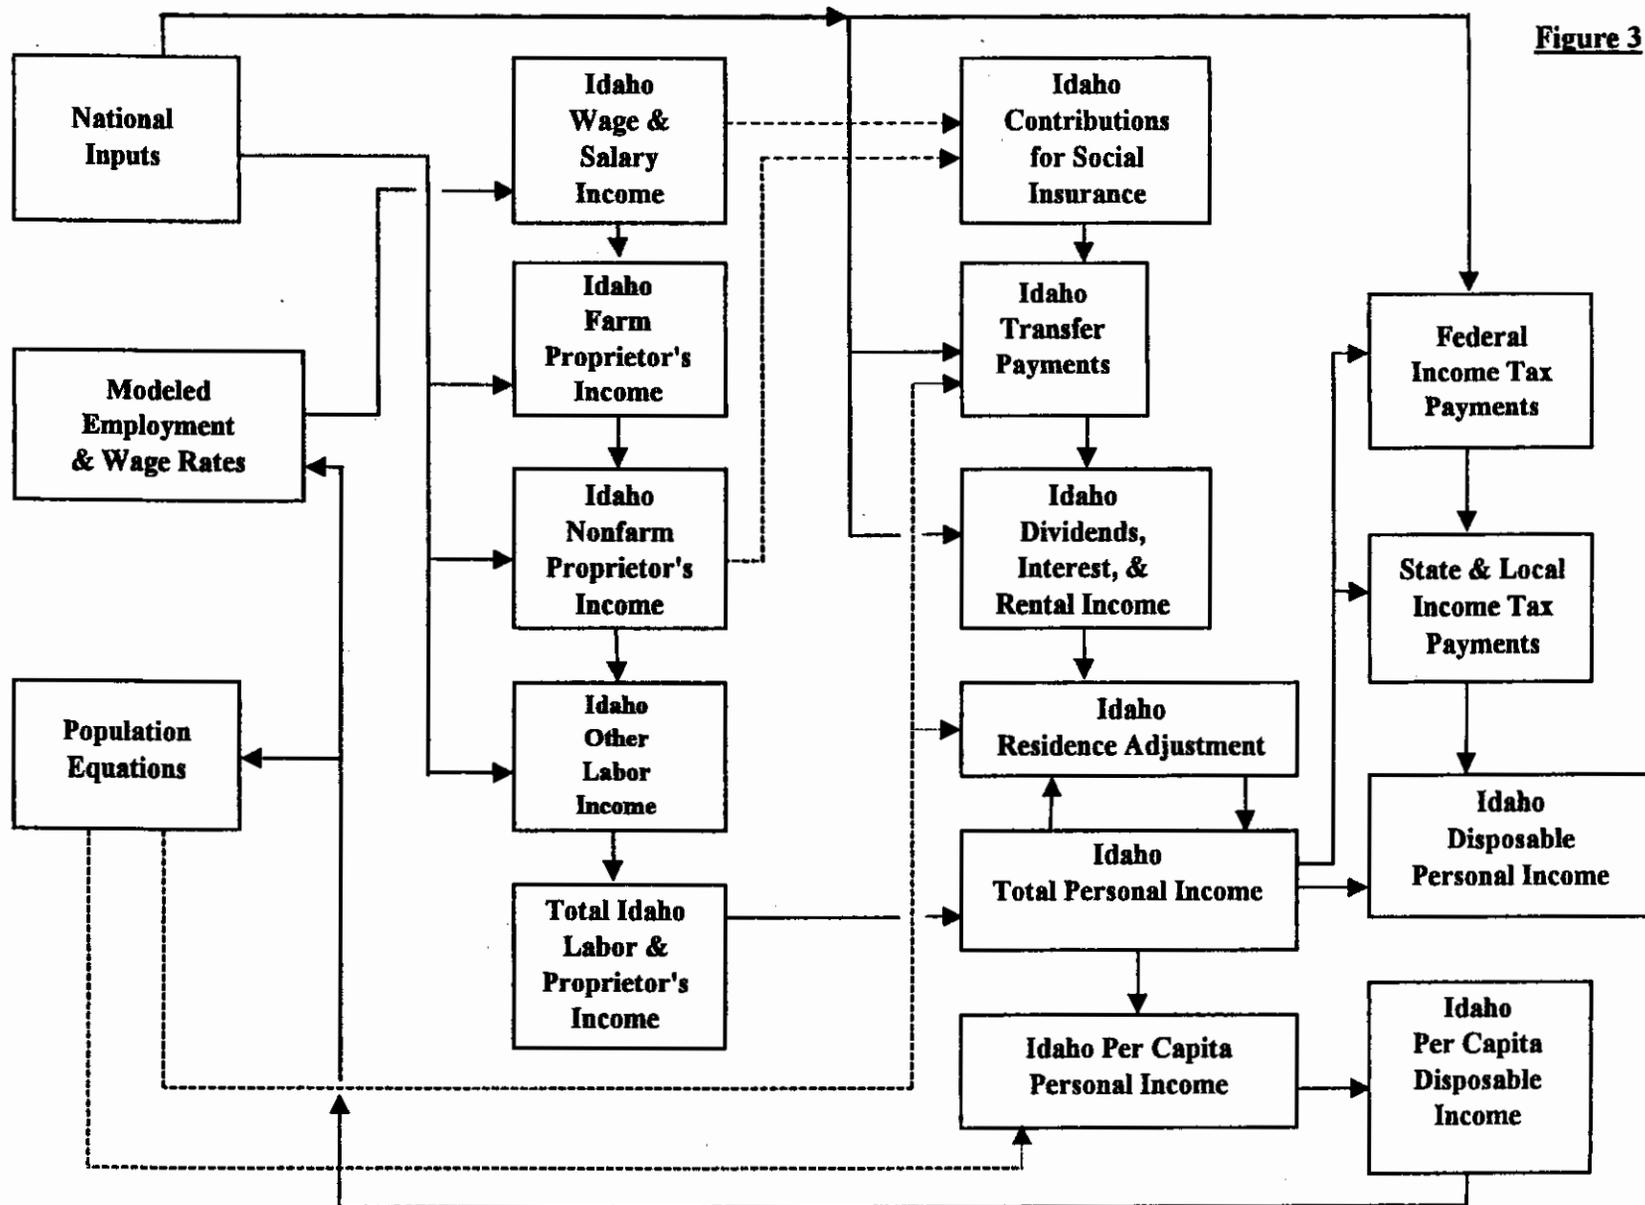

Idaho secondary industry employment a function of local economic activity as measured by Idaho real per capita disposable income and industry specific real wages. As in the basic industry equations, average wage and salary rates by industry are a function of U.S. industry wage trends and employment by industry is a function of local economic activity and wage rates.

The transition to the personal income sector of the model occurs through the concept of wage bills, the money paid in wages and salaries in each industry sector. Total wages and salaries are the sum of basic and secondary industry employment multiplied by each specific industry's wage rate.

## Idaho Economic Forecast Flow Chart of Personal Income Determination

**Figure 3**

## Per Capita Personal Income

Per capita personal income is the ratio of total personal income, from all sources and before income taxes, to total resident population. It is one indicator of the economic well-being of a state and plays an important role in any modeling effort of regional economic activity.

National per capita personal income has been consistently higher than that in the state of Idaho. Stronger economic conditions in the state have helped close the gap in the 1960 to 1980 period and during the most recent expansion, 1987 through 1995. However, despite faster growth, Idaho's per capita income has consistently been below the national average in absolute terms throughout this period.

Differences between state and national per capita income stem from several sources: industry mix, sources of unearned income, labor force participation rates, fertility rates, and the age distribution of the population. Per capita income in Idaho averages several hundred dollars below the national average. Part of this difference is due to Idaho's relatively large proportion of non-working age population, the result of Idaho's higher birth rates. This relationship reduces total earnings relative to "older" populations of the same number. Idaho's industry mix also contributes to the differences in per capita personal income. The predominance of relatively lower-paying basic industry jobs in Idaho are also a cause of the state's lower per capita income when compared to other regions having a higher proportion of higher-wage rate basic industry jobs.

Idaho total personal income is projected within the economic model by major income component, as depicted in Figure 3. Forecasts of total wage and salary income is the sum of the products of employment by industry times average annual wage and salary earnings by industry. Projections of non-farm proprietors' income, farm proprietors' income, and other labor income

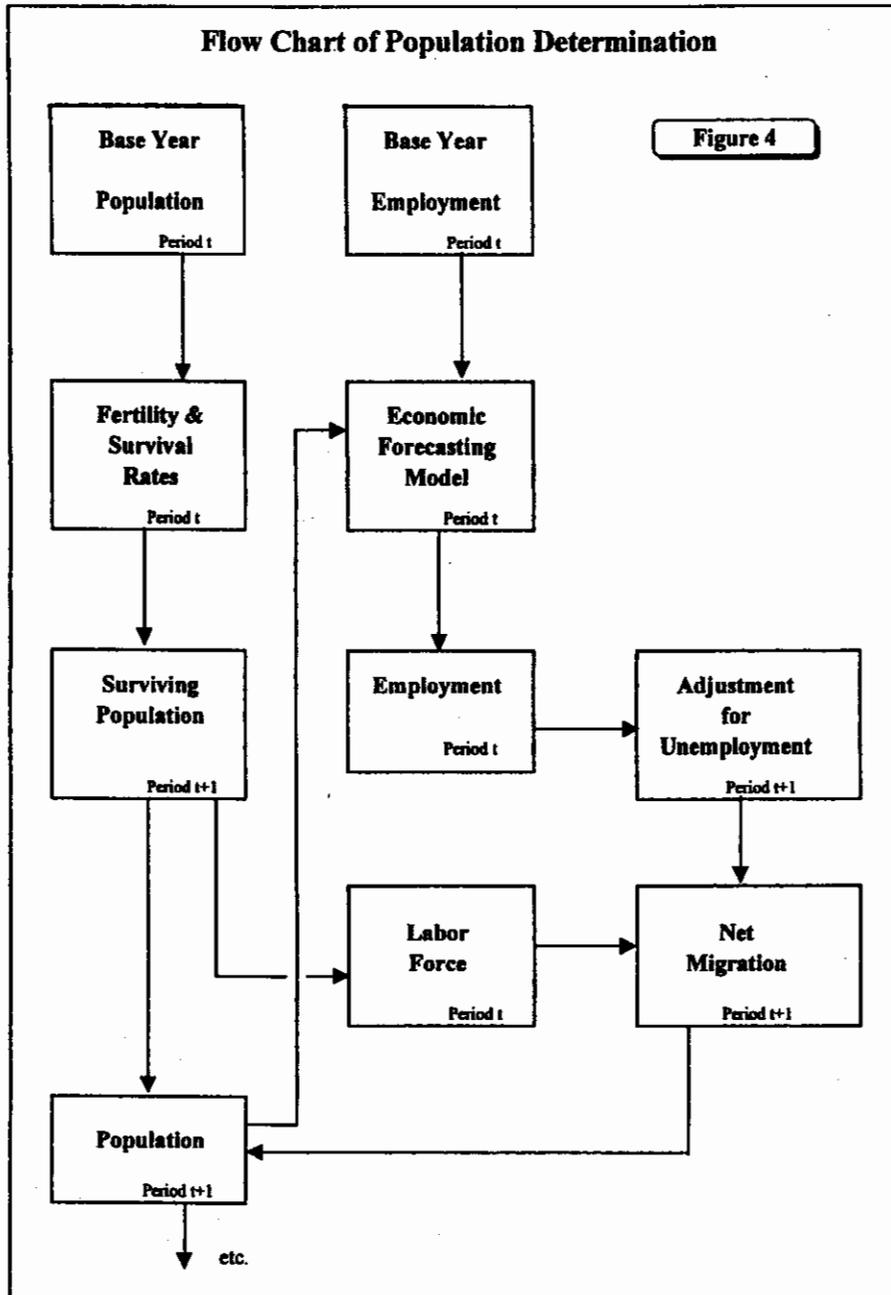

are added to the total wage and salary income to obtain a projection of total labor and proprietors' income. In the next step, total personal income is obtained by adding property income (dividends, interest, and rent) and transfer payments to the labor and proprietors' income, and subtracting contributions to social security, and making a "residence adjustment". This adjustment estimates the net difference of income inflows and outflows resulting from commuting employees, absentee landlords and proprietors.

Property income and transfer payments are modeled as a function of projected regional population and national property income and transfer payments per capita. Projected contributions to social security are expressed as a function of projected regional employment and national contributions per employee. Finally, per capita personal income is derived by dividing total personal income by the projected population.

The model further determines disposable personal income (personal income less personal income taxes), using an effective tax rate equation for federal and state taxes. Per capita disposable personal income is derived by dividing total disposable personal income by the projected population.

Finally, the projections of disposable personal income per capita is one of the determinants of employment in the secondary industry sectors, therefore causing the system of equations (employment, personal income, and population) to be simultaneous in their solution.

## Population

The population forecast utilizes a cohort-component method, which forecasts components of population change for each cohort a five-year age grouping; i.e., ages 0 to 4, 5 to 9, etc). The components of change in population are births, deaths, and migration. Births and deaths are projected by applying age and sex-specific fertility rates and death rates to the base-year population, which is carried forward into the next year.

The migration component of population change is projected by incorporating an total employment and labor force forecast. Labor force participation rates are applied to the existing working-age population, resulting in a locally supplied labor force. The net migration of workers makes up the difference between the labor force supplied by the existing population and the labor force produced by total employment and an "unemployment adjustment." The migrating workers are converted by an appropriate factor to a migrating population. This is then distributed by age in accordance with historical patterns. The migrating population is added to the "survived" base-year population and carried forward to the next year.

The population model projects net migration from the difference between the labor force supplied by the existing population and the required labor force projected by the employment forecast and the unemployment adjustment. In actuality, some portion of the population migrates out of the region (gross out-migration) and others migrate in (gross in-migration). Net migration is dependent on the level of employment and the size of the labor force supplied by the existing population.

Net migration is a critical component in the growth or decline of regional or local area population. The contribution of natural population increases, while important, is less subject to wide fluctuations because it is largely dependent on a gradually changing age structure. Even in a 20-year population forecast, the change in population, and the age structure resulting from natural increases alone is fairly certain because most of the population is already born and mortality rates behave predictably.
