IDAHO PUBLIC  
UTILITIES COMMISSION

DAVID J. MEYER  
VICE PRESIDENT, CHIEF CONSEL FOR  
REGULATORY AND GOVERNMENTAL AFFAIRS  
AVISTA CORPORATION  
P.O. BOX 3727  
1411 EAST MISSION AVENUE, MSC-13  
SPOKANE, WASHINGTON 99220-3727  
TELEPHONE: 509-495-4316  
FACSIMILE: 509-495-8851

**BEFORE THE IDAHO PUBLIC UTILITIES COMMISSION**

IN THE MATTER OF THE PETITION OF	)	
IDAHO POWER COMPANY FOR AN	)	CASE NO. IPC-E-05-22
ORDER TEMPORARILY SUSPENDING	)	
IDAHO POWER'S PURPA OBLIGATION	)	DIRECT TESTIMONY
TO ENTER INTO CONTRACTS TO	)	OF ROBERT J.
PURCHASE ENERGY GENERATED BY	)	LAFFERTY
WIND-POWERED SMALL POWER	)	
PRODUCTION FACILITIES	)	
	)	

ON BEHALF OF  
AVISTA CORPORATION

1 **I. INTRODUCTION**

2 **Q. Please state your name, employer and business address.**

3 A. My name is Robert J. Lafferty and I am employed as Manager, Wholesale  
4 Marketing & Contracts at Avista Corporation (Avista or Company) and my business  
5 address is 1411 East Mission Avenue, Spokane, Washington.

6 **Q. Please state your educational background and professional**  
7 **experience.**

8 A. I began my career at Avista Corp. in 1974 after graduating from  
9 Washington State University with a Bachelor of Arts degree in Business Administration  
10 and a Bachelor of Science degree in Electrical Engineering. In 1979, I passed the  
11 Professional Engineering License examination in the state of Washington. I have served  
12 in a variety of positions in the engineering, marketing, and energy resources departments.  
13 I began work in the energy resources area (electricity and natural gas) in March 1996, and  
14 have held various positions involving the planning, acquisition and optimization of  
15 energy resources. Since December 2003, I have served as Manager, Wholesale  
16 Marketing & Contracts where my responsibilities include acquisition and management of  
17 long-term electric resources.

18 **Q. What is the scope of your testimony in this proceeding?**

19 A. My testimony will address the unique characteristics of wind resources  
20 and the current circumstances that indicate that it is time to reassess how avoided costs  
21 should be computed for intermittent wind-powered resources. I will explain why Avista  
22 joins in Idaho Power's Petition that the Commission temporarily suspend the obligation  
23 to enter into new contracts with Qualifying Facilities (QFs) to purchase wind-powered

1 generation output at Commission approved published prices and terms. This suspension  
2 would be for a period of time during which an investigation would be conducted to  
3 consider the impacts and costs associated with integration of substantial amounts of wind  
4 resource.

5 **Q. What recent circumstances have manifested themselves with regard to**  
6 **acquisition of intermittent wind-powered resources in the state of Idaho?**

7 A. Idaho Power, in its Petition, indicates that it has received contacts  
8 representing a significant amount of QF wind resource since the issuance of Order No.  
9 29646. Idaho Power states that it has received approvals for contracts totaling 61.5  
10 megawatt (MW), have pending contracts before the Commission of contracts  
11 representing 21 MW, and have further inquiries representing an additional 193 MW of  
12 wind resource. This represents a total of 275.5 MW of wind resource. This amount  
13 exceeds Idaho Power's Integrated Resource Plan acquisition goal for wind resource in  
14 2005 of 200 MW. Idaho Power expresses concern regarding the incremental system  
15 impacts, including those to reliability, and associated system costs that may result from  
16 the acquisition of such large amounts of wind. Idaho Power notes in its Petition, at the  
17 time that the Commission adopted the combined cycle combustion turbine as the  
18 surrogate avoided resource for setting avoided costs, that neither the Commission nor  
19 Idaho Power had much experience with the integration of intermittent wind resource.

20 Avista has also been gaining experience with regard to integration of intermittent  
21 wind resources. On November 18, 2004, Avista began receiving the dynamic signal that  
22 integrated 35 MW of wind resource that it had acquired for a ten-year contact term. This  
23 represents Avista's first experience dynamically integrating a substantial wind resource

1 into its system. The quantity and speed with which wind resources are being proposed in  
2 Idaho points toward a need now to review the potential impacts and to assess the  
3 appropriate application of costs associated with integrating large amounts of wind  
4 resource.

5 **Q. Does wind-powered generation bring the same capacity and energy**  
6 **attributes to the purchasing utility as a combined-cycle combustion turbine**  
7 **(CCCT), which serves as the basis for the avoided cost resource in the state of**  
8 **Idaho?**

9 A. No. Wind-powered generation is only able to generate energy in an  
10 intermittent fashion. As such, wind-powered generation does not provide the schedulable  
11 capacity characteristics that are available from a CCCT. In contrast to a CCCT,  
12 additional system capacity must be made available in order to integrate a wind-powered  
13 resource into the power grid in a reliable fashion.

14 As discussed above, Avista purchases a 35 MW wind resource output under a ten-  
15 year agreement and integrates it into its system on a dynamic basis. Avista's system  
16 provides all capacity for shaping and ancillary services necessary to integrate this wind  
17 resource. Tables 1 and 2 contained in Exhibit No. 201 show the output from the 35 MW  
18 wind resource purchase contract. Table 1, shows Avista's hourly average output from  
19 that portion of the Stateline wind project for the month of January 2005. Table 2 shows  
20 Avista's share of daily average output from the project over the period January 1, 2005  
21 through June 30, 2005. These two tables show the variability associated with wind  
22 resource power production and illustrate the challenge of "firming" or shaping large

1 amounts resource with this type of output characteristic in order to match load  
2 requirements.

3 **Q. How are integration or “firming” services provided?**

4 A. As explained by Idaho Power witness Gale, firming of wind-powered  
5 generation can be provided by the purchase of “firming” services from third-party  
6 providers, if those services and necessary transmission are available on a firm basis or,  
7 alternatively, firming service can be provided by the utility purchasing the wind-powered  
8 generation using its own physical generating resources. In either case, physical  
9 equipment capacity must be available to provide the necessary “firming.” Such  
10 additional system capacity is not required in the case of a CCCT.

11 **Q. Is there a cost associated with providing the firming services**  
12 **associated with the integration of wind-powered generation resources?**

13 A. Yes. Third parties providing firming services charge for those services  
14 and for necessary transmission costs. Alternatively, utilities that provide their own  
15 firming services must dedicate plant capacity and make corresponding changes to system  
16 operations which results in a cost to the utility from using its physical capacity in a  
17 manner different from the way in which it is optimized today. Therefore, in either  
18 scenario, there are unique costs associated with integrating wind-powered resources.

19 **Q. Are there costs of integrating, or “firming,” wind resources that are**  
20 **not part of integration of a CCCT resource?**

21 A. Yes. Avista agrees with Idaho Power’s comments that there are costs  
22 associated with integrating intermittent wind-powered resources onto a utility’s power  
23 system that are not reflected in the published avoided cost rates approved by the

1 Commission. As discussed above, dedication of physical capacity and changes in system  
2 operations result in incremental costs associated with shaping and firming intermittent  
3 wind power output. As the amount of wind resource acquisition increases, the overall  
4 system impacts, along with associated costs, can also be expected to be more significant.  
5 It would be appropriate now to reassess how avoided costs should be computed for  
6 intermittent wind-powered generation.

7 **Q. Are other factors present, in addition to the administratively**  
8 **determined avoided cost rates, that are influencing the interest in and the amount of**  
9 **wind-powered generation development?**

10 A. Yes. Avista concurs with Idaho Power that federal and state tax  
11 incentives, including the federal income tax credit equal to approximately \$18 per  
12 megawatt-hour (MWh), have been recent significant factors stimulating wind-powered  
13 generation development. As indicated by Idaho Power in its Petition, the Federal income  
14 tax credit for wind resources was reinstated just prior to the issuance of Order No. 29646.  
15 The Northwest Conservation and Power Council data indicates that approximately 730  
16 MW of wind-powered generation capability is currently in operation in the region and  
17 that another approximately 3,000 MW of wind-powered generation capability is under  
18 construction or planned for construction. There is an active and competitive market for  
19 wind-powered generation development.

20 **Q. Has Avista issued specific RFP's for wind-powered generation**  
21 **resources?**

22 A. Yes. Avista issued an RFP in 2003 for wind-powered resources and,  
23 through that process, was able to acquire a competitively priced 35 MW wind resource

1 for a ten-year term. That transaction was completed in 2004 and Avista began taking  
2 deliveries in April of that year. As mentioned earlier, Avista began integrating that wind  
3 resource on a dynamic basis beginning in November 2004.

4 **Q. Does Avista share Idaho Power's concern that the prices and terms**  
5 **available to wind resources under PURPA could adversely affect future wind**  
6 **resource RFP's?**

7 A. Yes. Avista's draft 2005 Integrated Resource Plan (IRP) preferred  
8 resource strategy includes the planned acquisition of up to 400 MW of wind resource  
9 capability by the year 2016. Avista hopes to acquire a mix of geographically diversified  
10 wind resources primarily through competitive RFP or negotiation processes. As  
11 mentioned earlier, Avista has already acquired 35 MW of wind resource at a favorable  
12 price for a ten-year term through a competitive RFP process that took place prior to  
13 Commission Order No. 29646. Idaho Power cites Northwestern Energy's recent  
14 Montana Commission approval of an agreement with Judith Gap LLC under which  
15 Northwestern will purchase 135 to 150 MW of wind resource at a competitive price of  
16 \$31.71 per MWh. Avista shares Idaho Power's concern that the Commission approved  
17 published price, of approximately \$60 per MWh, coupled with the term offered for wind  
18 resources will cause the cost of the wind resources acquired to be much higher than if  
19 they were acquired from the market through competitive RFP or negotiated processes.

20 **Q. Are there other factors that could affect the cost of wind resources to**  
21 **the purchasing utility?**

22 A. Yes. Another unique characteristic of wind-powered generation is that  
23 projects can be configured in any number of different power output amounts. Wind

1 resource projects consist of greater or lesser numbers of relatively small (approximately 1  
2 MW to 1.5 MW each) generators. Therefore, wind developers can configure their  
3 projects to meet different project output definitions. As noted by Idaho Power, it would  
4 not be difficult for a wind project greater than 10 MW to be reconfigured into multiple  
5 projects less than 10 MW in order to qualify each project for the Commission approved  
6 published rates. Avista supports Idaho Power's Petition, which recommends a  
7 suspension of wind resource acquisition at this time, in part to prevent an unintended  
8 situation where wind project developers reconfigure their projects so that they fall below  
9 the threshold in order to qualify for posted rates.

10 It is important that a suspension apply to Avista to avoid creating an incentive for  
11 developers that are currently making their proposals to Idaho Power to shift their  
12 proposals to Avista. Accordingly, the rates, terms and conditions for all new contracts  
13 from the date of Avista's petition forward for wind QF developers delivering power to  
14 Avista's system in Idaho should, as with Idaho Power, be governed by the outcome of  
15 this proceeding.

16 **Q. What work will be done during the suspension period?**

17 A. During the suspension period, an investigation would take place that  
18 would assess the impacts to system costs and reliability related to the integration of  
19 significant amounts of intermittent wind resource onto Avista's electric system. The  
20 analysis should include an assessment of the total amount of intermittent wind resource  
21 that Avista's system can reasonably absorb, without affecting reliability, and the level of  
22 costs associated with different amounts of wind resource acquisition. The investigation

1 should consider appropriate application of those costs to the published avoided costs  
2 applicable to intermittent wind-powered resources.

3 **Q. Does that conclude your pre-filed direct testimony?**

4 A. Yes it does.
