Attorneys for Intermountain Gas Company

BEFORE THE IDAHO PUBLIC UTILITIES COMMISSION

IN THE MATTER OF THE APPLICATION OF)
INTERMOUNTAIN GAS COMPANY FOR)
THE AUTHORITY TO CHANGE ITS RATES) Case No. INT-G-16-02
AND CHARGES FOR NATURAL GAS)
SERVICE TO NATURAL GAS CUSTOMERS)
IN THE STATE OF IDAHO)
_____)

DIRECT TESTIMONY OF HART GILCHRIST

FOR INTERMOUNTAIN GAS COMPANY

August 12, 2016

1 A. My testimony will cover several areas.
2 First, I will discuss the delivery chain involved in bringing natural gas from the
3 well-head to the consumer, and the role Intermountain plays in the last part, or
4 local distribution, of that delivery chain. Second, I will provide some detail on
5 certain operations and maintenance expenses of the Company operating as a local
6 gas distribution company (“LDC”). Third, I will explain the Company’s focus on
7 building and maintaining a safe and reliable natural gas distribution system and
8 the costs incurred in that endeavor. Fourth, I will explain Intermountain’s
9 infrastructure replacement program and spending and lay out a proposal for a
10 future program and regulatory case that would allow the Company to identify
11 parts of its distribution system that has aged or has been identified as needing
12 replacement per federal pipeline safety programs to the point where it needs to be
13 replaced in the near-term, and how Intermountain can recover our replacement
14 costs more quickly for a portion of this pipeline replacement.

15 **II. GAS SUPPLY CHAIN**

16 **Q. Please describe Intermountain’s delivery chain. Where does Intermountain**
17 **acquire its natural gas and how is the cost of that wholesale commodity**
18 **passed through to customers of the Company?**

19 A. First, it is important to distinguish the role Intermountain plays as an LDC, and
20 that it is not a vertically integrated utility. By that, I mean it does not own any
21 producing gas wells that are ultimately used to supply its retail customers in
22 Idaho. Instead, the Company contracts with a wholesale supplier to acquire the
23 gas needed to meet its regulatory obligation to provide service to its Idaho

1 Customers. Currently, Intermountain has contracted with IGI Resources, Inc., a
2 wholly owned subsidiary of BP Energy (“IGI/BP”) to acquire wholesale gas on
3 behalf of Intermountain, and arrange, or contract, for transportation of that gas to
4 the Company’s various distribution systems in southern Idaho. That contracted-for
5 delivery occurs over an interstate pipeline system that is not owned by
6 Intermountain, but in the Company’s case, is owned by Williams-Northwest
7 Pipeline Company (“NW Pipeline”). Prices for wholesale gas acquired by IGI/BP
8 on behalf of Intermountain are market driven, while transportation costs paid to
9 NW Pipeline are at rate-of-return regulated prices set by FERC. Both gas
10 commodity costs and transportation costs are then passed through, dollar for
11 dollar, to Intermountain’s customers pursuant to the Company’s annual Purchased
12 Gas Adjustment (PGA) cost recovery filing.

13 **Q. Please describe Intermountain’s gas supply chain.**

14 A. Page 1 of Exhibit 3 is a simplified diagram of the gas supply chain from the gas
15 wellhead to the end consumer. As shown on this diagram, gas comes out of the
16 ground at the gas wellhead, which is independently owned, with the various wells
17 connected via a gathering system to a gas compressor station and gas processing
18 station. IGI/BP will acquire a gas supply on behalf of Intermountain from
19 producers/wholesalers who represent a wellhead owner. It does not matter to
20 Intermountain where the gas originates; it’s just a commodity to us. IGI then
21 contracts with one or more interstate pipeline owners to move the contracted-for
22 gas to a city gate or a farm tap, where Intermountain takes delivery of the
23 wholesale gas and distributes it to our customers.

1 **Q. Please describe what happens once Intermountain takes delivery of the**
2 **wholesale gas.**

3 A. The Company takes delivery of gas at a variety of points on the NW Pipeline
4 system that roughly correspond with the various Idaho cities, towns and farms
5 served by Intermountain. Those multiple delivery points are the “Gas Station” box
6 as shown on Exhibit 3, Page 1. Downstream from the “Gas Station” box on Page
7 1 of Exhibit 3 is the portion of the diagram showing storage facilities, compressor
8 stations, distribution pipelines, and industrial, commercial and residential
9 consumers. All of these facilities and infrastructure are designed and built to
10 deliver gas supply to core market and non-interruptible industrial customers on
11 the coldest peak-day period. The storage facilities, or liquid natural gas (LNG)
12 facilities are an additional failsafe necessary to provide deliverability and
13 reliability on the coldest peak-day period. Peak-day is defined as the maximum
14 daily quantity of gas distributed through the Company’s system. In order to meet
15 peak-day demand, the Company has to design and build the distribution system
16 with enough capacity (or using correct pipe size and pressure blends) to meet this
17 demand, regardless of what the demand is on non-peak days. The Company
18 receives the gas at pressures between 500-800 psig and through a series of
19 pressure cuts (via regulators at city gates, district regulator stations and domestic
20 regulators) delivers gas to our customers between 20 psig and 4 oz.

21 **Q. Where does Intermountain provide retail gas service in Idaho, and what is**
22 **the Company’s customer base.**

1 A Page 2 of Exhibit 3 shows a map of the Company's service area in southern
2 Idaho. The Company's current customer base consists of 302,790 residential
3 customers and 31,860 commercial customers.

4 **III. OPERATIONS AND MAINTENANCE OF PLANT AND**
5 **FACILITIES**

6 **Q. Please describe the Company's operation centers in Idaho and elsewhere that**
7 **support customers in Idaho.**

8 A. The Company has a general office, five (5) major operations centers with two (2)
9 satellite service centers serving Intermountain customers, as well as a customer
10 service center in Meridian. The general office, located in Boise, is made up of
11 Intermountain's administrative staff. This staff includes Intermountain's
12 executive team and employees that lead Intermountain's safety, training,
13 operations, engineering, accounting, regulatory, human resources, cash
14 processing, marketing/public relations, information technology and geographic
15 information systems. Each of the five operations centers is made up of our
16 operations and service groups. These groups provide all field service activities,
17 operations and maintenance (pipeline safety compliance) activities, customer
18 acquisition activities and emergency response activities. These five operations
19 centers are located in Nampa, Boise, Twin Falls, Pocatello and Idaho Falls. The
20 two satellite service centers, located in Hailey and Soda Springs, respectively,
21 provide field service activities and emergency response activities in our more
22 remote areas. The MDU Resources' customer service center, located in Meridian,
23 serves over a million customers in eight (8) states across 4 brands: Intermountain,

1 Cascade Natural Gas, Montana-Dakota Utilities and Great Plains Natural Gas.
2 The 2010 addition of the customer service center has been an asset to Idaho's
3 economy and Intermountain is fortunate that MDU Resources selected Idaho and
4 Meridian in particular to make this significant capital investment for its customer
5 service center.

6 **Q. Could you please describe the effort and investment the Company has made**
7 **in information and technology systems?**

8 A. Yes, but first let me set the stage for you. In 1985, Intermountain served less
9 than 100,000 customers with approximately 425 employees, compared to serving
10 approximately 330,000 customers today with 241 employees, plus shared services
11 employees. We have been able to achieve this significant reduction in customer-
12 to-employee ratio through several avenues: transformation of the personal
13 computer; operations mobile field solutions, including electronic field order
14 completion and leak survey; implementation of encoder receiver transmitters
15 (ERT's) on customer meters; integrated geographic information system (GIS);
16 electronic pipeline safety compliance system that interfaces with GIS and;
17 electronic work management system. Each of these technology implementations
18 has allowed Intermountain to streamline work processes, reduce paperwork and
19 back-office activities and continue to maintain a safe, reliable distribution system.

20 **Q. How have O&M costs historically been maintained, reduced or deferred in**
21 **the past?**

22 A. One example, as referenced above related to ERT's, pertains to the 2001-2002
23 implementation of the company's automated meter reading (AMR) system. The

1 AMR system included the installation of approximately 280,000 ERT's on
2 customer meters and the implementation of three mobile collectors installed in
3 vehicles to capture monthly meter reads. Prior to the implementation of the AMR
4 system, Intermountain collected monthly customer meter reads manually, on foot,
5 using 27 meter reader staff. Upon completion of the AMR implementation, the
6 company is able to read the same amount of customer meters with 7
7 employees. Intermountain continues to read 330,000 customer meters today with
8 the same number of employees, thus deferring additional O&M costs of additional
9 employees since 2001.

10 IV. SAFETY

11 **Q. Many of Intermountain's operating expenses relate to the Company's**
12 **commitment to both customer safety and employee safety. Please give us an**
13 **idea of the safety systems the Company has in place regarding customer**
14 **safety, and how that impact's system operations.**

15 A. Intermountain is committed to customer safety. As part of this commitment,
16 Intermountain has an extensive pipeline safety program, which will be discussed
17 later in this testimony as well as a dedicated staff of employees to address
18 customer needs and concerns as well as natural gas emergencies. The company's
19 first responders are trained to assess, make safe and repair any abnormal operating
20 conditions on the distribution system. This group of employees is made up of
21 service technicians and construction crews. The company keeps employees in
22 these positions on stand-by 24 hours per day, seven days per week to allow for
23 quick response to customer needs, facility damages and outages. This is

1 accomplished by investing in safety and ensuring a qualified workforce. All of
2 our operations employees go through a series of training modules covering all
3 aspects of their jobs and have to display competency through testing and hands-on
4 evaluations. This program is called Operator Qualification. Additionally, our
5 service technicians go through an extensive service technician apprentice program
6 which consists of classroom training as well as ride-a long's with seasoned
7 employees. Service technicians cannot be on-call or respond to emergencies on
8 their own until the successful completion of the apprentice program which takes
9 one full year. All of these programs help ensure that the company provides a
10 qualified workforce that prudently operates the distribution system and provides a
11 safe system for our customers.

12 **Q. You also mentioned employee safety as the second part of Intermountain's**
13 **safety commitment. Please elaborate?**

14 A. Intermountain's employee safety goal is "Commitment to Zero", evidencing a
15 drive towards zero vehicle accidents and zero employee injuries. As such, the
16 Company views safety as an investment, although in reality it is an operating
17 expense. As part of Intermountain's *Commitment to Zero* the Company provides
18 all necessary Personal Protective Equipment (PPE) to its employees. This
19 includes the likes of hard hats, safety glasses, high visibility clothing, gloves,
20 safety toe footwear, etc. The Company also provides its employees with regular
21 safety training as well as defensive driving training specifically geared toward
22 zero accidents. Intermountain's belief is that a serious commitment to and

1 investment in safety will help to ensure that Intermountain's employees go home
2 in the same condition they came to work in.

3 **Q. What are some of the federal safety requirements that are driving the**
4 **Company's maintenance costs?**

5 A. Intermountain has several processes or systems in place that help ensure the safe
6 operation of our distribution system. Most of these are derived from federal
7 pipeline safety requirements that can be found in the Code of Federal Regulations,
8 Title 49, Part 192. Specifically, I will discuss the following areas: Leak Survey,
9 Corrosion, Atmospheric Corrosion, Public Awareness, Damage Prevention,
10 Regulator Station inspection and testing, Valve maintenance, Transmission
11 Integrity Management and Distribution Integrity Management. Intermountain
12 applies these processes to approximately 6,216 miles (32 million feet) of gas
13 mainline and approximately 350,000 service lines.

14 **Q. Please explain the federal Leak Survey, Corrosion and Atmospheric**
15 **Corrosion requirements?**

16 A. Leak Survey: Intermountain is required to leak survey all natural gas
17 distribution pipelines of its non-business districts every four (4) years and those in
18 business districts annually. The Company is required to survey all natural gas
19 transmission lines annually and if they fall in a Class 3 location (46 or more
20 buildings intended for human occupancy within 220 yards of the pipeline of any
21 continuous mile) have to be surveyed twice annually.

22 Corrosion: For all steel natural gas pipelines, Intermountain must protect
23 them against external corrosion using the following means: (1) install pipelines

1 with an external protective coating; (2) have a cathodic protection system
2 installed which is designed to protect the pipe; typically this “system” is a
3 combination of anodes and rectifiers. These systems have to be annually
4 inspected to insure they are functioning properly to protect the steel pipelines
5 against external corrosion. This is done by measuring the “pipe-to-soil” interface
6 of cathodically protected and isolated pipe districts, regardless of the use of
7 anodes or rectifiers. In addition, rectifiers are inspected every two (2) months to
8 ensure they are properly protecting the steel pipe.

9 Atmospheric Corrosion: All pipe and components related to the natural
10 gas pipeline system that are above ground and exposed to the atmosphere are
11 inspected every three (3) years to ensure the atmosphere is not causing any
12 deterioration to our system.

13 **Q. Please explain the federal Public Awareness, Damage Prevention, Regulator**
14 **Station inspection and testing requirements.**

15 A. Public Awareness: Intermountain follows the American Petroleum
16 Institute (API) Recommended Practice (RP) 1162 which is incorporated by
17 reference into Part 192. Activities surrounding public awareness include
18 educating the public, appropriate government organizations and persons engaged
19 in excavation activities on the following: (1) use of the Idaho one call (Digline)
20 system prior to excavation; (2) possible hazards associated with unintended
21 releases from a gas pipeline facility; (3) physical indications that such a release
22 may have occurred; (4) steps that should be taken for public safety in the event of
23 a gas pipeline release; and (5) procedures for reporting such an event.

1 Damage Prevention: The Company engages in location of gas facilities
2 prior to excavation work (when notified by the excavator) through its contractual
3 relationship with Digline of Idaho. Excavators can call Digline at no charge to
4 the excavator. Digline then contacts a Company representative who locates
5 Intermountain gas facilities within 48 hours of the request. Additionally,
6 Company representatives regularly meet with excavators to educate them about
7 the importance of safe excavation.

8 Regulator Station inspection and testing: The Company inspects each
9 regulator station and its equipment on an annual basis to ensure it is in good
10 mechanical condition, has adequate capacity and reliability, is set to control,
11 increase or relieve pressure, and is properly installed and protected from dirt,
12 liquids, and other conditions that could prevent proper operations. Across
13 Intermountain's distribution system, the Company has 664 regulator stations that
14 receive this annual maintenance.

15 Valve Maintenance: Each Company valve that is either on a transmission
16 class pipeline or which may be used for the safe isolation of Intermountain's
17 system is required to be and is inspected annually. For transmission class valves
18 this includes partially operating the valve; for the remaining valves this includes
19 checking and servicing the valves. The Company has 5,115 valves that receive
20 this annual maintenance.

21 **Q. Finally, what are the federal safety requirements related to Transmission**
22 **Integrity Management and Distribution Integrity Management?**

1 A. Transmission Integrity Management Plan (TIMP): The Company
2 implements the TIMP on any segment of transmission pipeline that falls in a High
3 Consequence Area (HCA). An HCA is an area or circle along the transmission
4 pipeline containing either 20 or more buildings intended for human occupancy, or
5 an otherwise identified site. The company has 290 miles of transmission pipeline
6 and 14 of those miles are in an HCA. There are 42 specific pipe segments that fall
7 under the TIMP. Federal TIMP requirements subjects covered pipelines in TIMP
8 areas to a process of threat identification, risk assessment, baseline assessment,
9 repair/maintenance, preventative and mitigative measures, quality control,
10 performance management and management of change, followed by reassessment
11 of each segment of covered pipeline every seven years.

12 Distribution Integrity Management Plan (DIMP): The federal DIMP
13 safety requirements consists of seven elements: 1) Demonstrate knowledge of
14 distribution system; 2) Identify threats; 3) Evaluate and prioritize risk; 4) Identify
15 and implement measures to address risk; 5) Measure performance, monitor results
16 and evaluate effectiveness; 6) Perform periodic evaluation and improvement; and
17 7) Report results. The Company implements the DIMP on any segment of
18 distribution line in the company territory; in other words, the entire distribution
19 system that is within the company's jurisdiction.

20 **Q. Please describe the O&M costs related to these safety processes and**
21 **programs in 2015, as well as how they have trended historically and how the**
22 **company expects them to trend in the future.**

1 A. Intermountain's O&M costs related to District Operations each year can be
2 attributed to the safety and maintenance of our pipeline system. These are costs
3 associated with our field employees, tools and equipment, which are responsible
4 for carrying out the safety programs and processes previously discussed. In 2015,
5 the District Operations O&M cost were \$17.825 million. While these costs have
6 certainly increased over the last 30 years due to salary increases, cost of living
7 increases, etc., the company has been able to control these costs remarkably
8 well. For example, in 2011, these same O&M costs were \$16.333 million. In the
9 future, the expectation is that O&M costs will continue to rise, but at a more
10 accelerated rate due to recent and upcoming pipeline safety regulations, notably
11 DIMP and associated aging infrastructure replacements as referenced above, as
12 well as pending transmission pipeline regulation, quality assurance regulation and
13 pipeline safety management system regulation, to name a few.

14 **V. PIPELINE REPLACEMENT**

15 **Q. The fourth point you wished to discuss was the Company's investment in gas**
16 **pipeline infrastructure. Could you give an overview of the Company's**
17 **commitment to and spending on infrastructure replacement?**

18 A. Intermountain's annual capital requirements has steadily increased from
19 approximately \$ 17 million in 2008, to approximately \$42 million in 2015.
20 Capital spending of \$43.5 million and \$42 million is planned for the years 2016
21 and 2017 respectively. A significant portion of this capital spending relates to
22 infrastructure replacement

1 **Q Please describe Intermountain’s ongoing program for managing and**
2 **replacing its natural gas pipe?**

3 A. The Company is continuing its pipeline integrity management program to
4 systematically replace select portions of pipe in its natural gas distribution system
5 in Idaho. The pipeline integrity management program is a risk based replacement
6 program that assesses risk based on a pipe segments age, material, operating
7 pressure, leak history, damage history, etc. Intermountain began replacing
8 infrastructure in 2015 under the Distribution Pipeline Integrity rule that became
9 effective in 2013. Since 2005, Intermountain has been conducting pipeline
10 assessments on our transmission pipelines, but have only had to make minor
11 repairs. In 2015 under the company’s DIMP, approximately 30,000 feet of plastic
12 pipe was removed and replaced. The company plans to remove another 22,000 in
13 2016 and 25,000 in 2017. The company will continue to model the distribution
14 system and schedule replacement of pipe as determined by the risk model and
15 available monetary resources.

16 **Q. Please describe Intermountain’s protocol for pipeline replacement?**

17 A. Intermountain uses its TIMP and DIMP as drivers for pipeline replacement.
18 These two plans both use a risk-based approach to assessing pipelines and
19 determining which segments of pipe need repair or replacement. Once pipe
20 segments have been identified for replacement, the company assesses the capital
21 requirements for replacement compared to capital available in a given year. This
22 then determines how much replacement can be achieved in a given year.

1 **Q. Do you believe the current pace for pipeline replacement and the system for**
2 **rate basing that investment is adequate, or is there a potentially better**
3 **regulatory model for more expeditiously replacing pipe that is at or near the**
4 **end of its useful life?**

5 A. I believe a better way to more quickly fund and replace pipeline infrastructure
6 would be through a pipeline infrastructure cost recovery mechanism (ICRM) that
7 would allow Intermountain to accelerate its spending in this area, and to more
8 timely recover those costs that are incurred to promote the safety and reliability of
9 Intermountain's distribution system.

10 **Q. Is Intermountain proposing a pipeline ICRM in this case?**

11 A. No. However, the Company intends to follow this case with an ICRM case filing.

12 **Q. Why is the eventual establishment of a pipeline ICRM important to**
13 **Intermountain?**

14 A. There are many portions of Intermountain's system that need to be considered for
15 replacement based on material, age, leak history, excavation activity, etc.
16 Intermountain is obligated to provide safe, reliable service to its customers, and to
17 that end, Intermountain is using a systematic approach to identify the elevated risk
18 pipe segments and replace those segments first. A potential problem for the
19 Company is that the costs incurred for replacing pipe has no new revenue
20 associated with those costs. In other words, performing these system
21 improvements increases costs and reduces earnings.

22 **Q. How has Intermountain been able to incur these costs without rate recovery**
23 **to date?**

1 A. Over the past few years Intermountain has primarily funded its pipeline
2 improvement program through operating efficiency improvements, many of them
3 resulting from the MDU Resources' acquisition of Intermountain. However, rate
4 base and other cost increases have reached the point that Intermountain can no
5 longer fund this large a capital investment from additional operating efficiencies.

6 **Q. What are the benefits to customers and the Company if a pipeline cost
7 recovery mechanism were established and approved by the Commission?**

8 A. In addition to updating the pipeline system to continue operating a safe and
9 reliable system, the mechanism will potentially reduce the need for future rate
10 cases. Without an ICRM, Intermountain will likely be in a position where it will
11 need to file subsequent rate cases for cost recovery of this single and significant
12 capital spending program, until such time as the Company's modeling indicates
13 an acceptable level of risk profile is attained. An ICRM will provide an incentive
14 for the Company to control other costs between rate cases and reduce the need for
15 incurring additional rate case costs.

16 **Q. Can you please describe how such a mechanism would work?**

17 A. Yes. Intermountain would annually file for recovery of pipeline replacement
18 investment incurred over a set period of time, likely a 12 month period. It would
19 also seem that the timing of the filing might best coincide with Intermountain's
20 annual PGA filings in August, with an effective date of October 1. The period of
21 recovery for the prior year's investment would be a matter for determination by
22 the Commission.

1 **Q. Do other MDU Resources' Companies and other gas utilities in the northwest**
2 **currently have a similar mechanism in place in other states?**

3 A. Yes. Cascade Natural Gas is operating under similar programs in both Oregon
4 and Washington where it files for recovery of pipeline replacement costs under a
5 pipeline CRM. In addition, Northwest Natural Gas currently has a System
6 Integrity Program, which was adopted to encourage Northwest Natural to replace
7 bare steel and cast iron pipe. Cascade's Washington cost recovery mechanism was
8 based on Northwest Natural mechanism in place in Oregon.

9 **Q. Do you anticipate that there would be O&M savings associated with the**
10 **replacement of some of the aging infrastructure?**

11 A. As a general rule, there will be less O&M costs associated with new
12 infrastructure, as opposed to aging or obsolete pipelines. On a net basis however,
13 Intermountain will continue to see overall increased O&M costs to maintain a
14 system, some of which is now approaching 60 years in age. It is important for the
15 Company to systematically reinvest and upgrade a portion of its pipeline system
16 every year, in addition to making the investments needed or required to meet
17 reliability requirements. While such systematic reinvestment works to slow the
18 growth of annual O&M costs, it does not result in a year to year reduction in
19 overall O&M costs.

20 **Q. Does this conclude your direct testimony?**

21 A. Yes. Thank you.
